UNDERSTANDING WHAT ACIDS ARE

ACIDS ARE A FUNDAMENTAL CLASS OF CHEMICAL COMPOUNDS THAT PLAY A VITAL ROLE IN CHEMISTRY AND BEYOND. IN THE SIMPLEST TERMS, AN ACID IS A SUBSTANCE THAT TENDS TO DONATE A PROTON (A HYDROGEN ION, H^+) WHEN DISSOLVED IN WATER. THIS CHARACTERISTIC DONATION OF A PROTON IS CENTRAL TO DEFINING ACIDIC BEHAVIOR. WHEN AN ACID DISSOLVES, IT INCREASES THE CONCENTRATION OF HYDROGEN IONS IN THE SOLUTION, WHICH IS WHAT GIVES IT ITS ACIDIC PROPERTIES.

DEFINING ACIDS: THE ARRHENIUS DEFINITION

THE ARRHENIUS DEFINITION, ONE OF THE EARLIEST AND MOST STRAIGHTFORWARD WAYS TO CLASSIFY ACIDS, STATES THAT AN ACID IS A SUBSTANCE THAT DISSOCIATES IN WATER TO PRODUCE HYDROGEN IONS (H^+). FOR EXAMPLE, HYDROCHLORIC ACID (HCl) DISSOCIATES IN WATER TO FORM H^+ AND CHLORIDE IONS (Cl^-). THIS INCREASE IN H^+ CONCENTRATION IS THE HALLMARK OF AN ACIDIC SOLUTION ACCORDING TO THIS DEFINITION. WHILE USEFUL, THE ARRHENIUS DEFINITION IS LIMITED TO AQUEOUS SOLUTIONS AND DOESN'T COVER ALL ACIDIC SUBSTANCES.

DEFINING ACIDS: THE BRØNSTED-LOWRY DEFINITION

A MORE COMPREHENSIVE DEFINITION COMES FROM THE BRØNSTED-LOWRY THEORY, WHICH DEFINES AN ACID AS A PROTON DONOR. THIS DEFINITION IS BROADER BECAUSE IT DOESN'T RESTRICT ITSELF TO AQUEOUS SOLUTIONS. IN THIS CONTEXT, AN ACID IS A MOLECULE OR ION THAT CAN TRANSFER A PROTON TO ANOTHER MOLECULE OR ION, WHICH IS THEN CALLED A BASE.

THIS CONCEPT HIGHLIGHTS THE TRANSACTIONAL NATURE OF ACIDITY, WHERE ONE SUBSTANCE DONATES A PROTON TO ANOTHER.

DEFINING ACIDS: THE LEWIS DEFINITION

THE LEWIS DEFINITION OF AN ACID IS THE MOST ENCOMPASSING. A LEWIS ACID IS A SUBSTANCE THAT CAN ACCEPT AN ELECTRON PAIR. THIS DEFINITION EXTENDS THE CONCEPT OF ACIDITY BEYOND PROTON TRANSFER TO INCLUDE REACTIONS INVOLVING ELECTRON PAIRS. FOR INSTANCE, BORON TRIFLUORIDE (BF₃) ACTS AS A LEWIS ACID BY ACCEPTING AN ELECTRON PAIR FROM A LEWIS BASE LIKE AMMONIA (NH₃). THIS PERSPECTIVE IS CRUCIAL FOR UNDERSTANDING A WIDER RANGE OF CHEMICAL REACTIONS, PARTICULARLY IN ORGANIC CHEMISTRY.

KEY CHARACTERISTICS OF ACIDS

ACIDS EXHIBIT A DISTINCT SET OF PROPERTIES THAT ALLOW FOR THEIR IDENTIFICATION AND CLASSIFICATION. THESE CHARACTERISTICS ARE CONSISTENT ACROSS VARIOUS TYPES OF ACIDS AND ARE FUNDAMENTAL TO UNDERSTANDING THEIR BEHAVIOR IN CHEMICAL REACTIONS AND EVERYDAY APPLICATIONS.

TASTE AND FEEL

MANY COMMON ACIDS HAVE A SOUR TASTE. THIS IS WHY CITRUS FRUITS, WHICH CONTAIN CITRIC ACID, TASTE TART. FOR EXAMPLE, LEMONS AND LIMES ARE ACIDIC. HOWEVER, IT IS CRUCIAL TO REMEMBER THAT TASTING UNKNOWN CHEMICALS IS EXTREMELY DANGEROUS AND SHOULD NEVER BE ATTEMPTED. ACIDS CAN ALSO FEEL STINGY OR CORROSIVE ON THE SKIN, ESPECIALLY IN HIGHER CONCENTRATIONS, DUE TO THEIR ABILITY TO REACT WITH PROTEINS AND TISSUES.

REACTIONS WITH METALS

ACIDS REACT WITH MANY REACTIVE METALS TO PRODUCE HYDROGEN GAS AND A METAL SALT. FOR INSTANCE, WHEN HYDROCHLORIC ACID REACTS WITH ZINC, IT PRODUCES ZINC CHLORIDE AND HYDROGEN GAS: $\text{Zn} + 2\text{HCl} \rightarrow \text{ZnCl}_2 + \text{H}_2$. THIS REACTION IS A CLASSIC DEMONSTRATION OF ACIDIC PROPERTIES AND THE REACTIVITY OF METALS. THE VIGOR OF THIS REACTION DEPENDS ON THE REACTIVITY OF THE METAL AND THE CONCENTRATION OF THE ACID.

REACTIONS WITH CARBONATES AND BICARBONATES

ACIDS REACT WITH CARBONATES AND BICARBONATES TO PRODUCE CARBON DIOXIDE GAS, WATER, AND A SALT. A COMMON EXAMPLE IS THE REACTION OF VINEGAR (ACETIC ACID) WITH BAKING SODA (SODIUM BICARBONATE): $\text{HC}_2\text{H}_3\text{O}_2 + \text{NaHCO}_3 \rightarrow \text{NaC}_2\text{H}_3\text{O}_2 + \text{H}_2\text{O} + \text{CO}_2$. THIS EFFERVESCENT REACTION IS OFTEN USED IN HOUSEHOLD CLEANING AND COOKING, SHOWCASING THE CHARACTERISTIC RELEASE OF CARBON DIOXIDE GAS.

CONDUCTIVITY

SOLUTIONS OF ACIDS IN WATER CONDUCT ELECTRICITY BECAUSE ACIDS DISSOCIATE INTO IONS, CREATING A CONDUCTIVE MEDIUM. THE STRENGTH OF THE ACID DETERMINES THE EXTENT OF DISSOCIATION AND THUS ITS CONDUCTIVITY. STRONG ACIDS, LIKE SULFURIC ACID, DISSOCIATE ALMOST COMPLETELY, LEADING TO HIGHLY CONDUCTIVE SOLUTIONS. WEAK ACIDS, SUCH AS ACETIC ACID, ONLY PARTIALLY DISSOCIATE, RESULTING IN LOWER CONDUCTIVITY.

COMMON EXAMPLES OF ACIDS

THE WORLD IS FULL OF ACIDS, FROM THE ONES WE CONSUME TO THOSE USED IN INDUSTRIAL PROCESSES. RECOGNIZING THESE COMMON ACIDS HELPS IN UNDERSTANDING THEIR PRESENCE AND IMPACT IN OUR DAILY LIVES.

- HYDROCHLORIC ACID (HCl): FOUND IN STOMACH ACID, ESSENTIAL FOR DIGESTION.
- SULFURIC ACID (H_2SO_4): USED IN CAR BATTERIES AND FERTILIZER PRODUCTION.
- NITRIC ACID (HNO_3): USED IN FERTILIZER PRODUCTION AND EXPLOSIVES MANUFACTURING.
- ACETIC ACID (CH_3COOH): THE PRIMARY COMPONENT OF VINEGAR.
- CITRIC ACID ($\text{C}_6\text{H}_8\text{O}_7$): FOUND IN CITRUS FRUITS LIKE LEMONS AND ORANGES.
- CARBONIC ACID (H_2CO_3): FORMED WHEN CARBON DIOXIDE DISSOLVES IN WATER, PRESENT IN CARBONATED DRINKS.

UNDERSTANDING WHAT BASES ARE

BASES, ALSO KNOWN AS ALKALIS WHEN DISSOLVED IN WATER, ARE ANOTHER FUNDAMENTAL CATEGORY OF CHEMICAL COMPOUNDS WITH DISTINCT PROPERTIES. THEY ARE OFTEN CONSIDERED THE CHEMICAL OPPOSITE OF ACIDS. A BASE IS GENERALLY DEFINED AS A SUBSTANCE THAT ACCEPTS A PROTON OR DONATES A HYDROXIDE ION (OH^-) IN SOLUTION. THIS ACCEPTANCE OF A PROTON OR DONATION OF HYDROXIDE IONS IS WHAT DEFINES THEIR BASIC CHARACTER.

DEFINING BASES: THE ARRHENIUS DEFINITION

ACCORDING TO THE ARRHENIUS DEFINITION, A BASE IS A SUBSTANCE THAT DISSOCIATES IN WATER TO PRODUCE HYDROXIDE IONS (OH^-). FOR INSTANCE, SODIUM HYDROXIDE (NaOH) DISSOCIATES IN WATER TO FORM SODIUM IONS (Na^+) AND HYDROXIDE IONS (OH^-). THIS INCREASE IN OH^- CONCENTRATION IS THE DEFINING FEATURE OF A BASIC SOLUTION UNDER THIS DEFINITION. LIKE ITS DEFINITION FOR ACIDS, THE ARRHENIUS DEFINITION IS PRIMARILY FOR AQUEOUS SOLUTIONS.

DEFINING BASES: THE BRØNSTED-LOWRY DEFINITION

THE BRØNSTED-LOWRY THEORY DEFINES A BASE AS A PROTON ACCEPTOR. IN THIS VIEW, A BASE IS A SUBSTANCE THAT CAN ACCEPT A PROTON FROM AN ACID. THIS CONCEPT IS COMPLEMENTARY TO THE BRØNSTED-LOWRY DEFINITION OF AN ACID; IN ANY ACID-BASE REACTION, THERE IS A PROTON DONOR (THE ACID) AND A PROTON ACCEPTOR (THE BASE). WATER, FOR EXAMPLE, CAN ACT AS A BASE BY ACCEPTING A PROTON FROM AN ACID LIKE HCl TO FORM HYDRONIUM IONS (H_3O^+).

DEFINING BASES: THE LEWIS DEFINITION

THE LEWIS DEFINITION EXTENDS THE CONCEPT OF BASES TO ELECTRON PAIR DONORS. A LEWIS BASE IS A SUBSTANCE THAT CAN DONATE AN ELECTRON PAIR TO FORM A CHEMICAL BOND. THIS ALIGNS WITH THE LEWIS DEFINITION OF AN ACID AS AN ELECTRON PAIR ACCEPTOR. MANY MOLECULES AND IONS THAT ARE NOT TRADITIONAL ARRHENIUS BASES, SUCH AS AMMONIA (NH_3) AND WATER (H_2O), CAN ACT AS LEWIS BASES BY DONATING A LONE PAIR OF ELECTRONS.

KEY CHARACTERISTICS OF BASES

BASES POSSESS A UNIQUE SET OF PHYSICAL AND CHEMICAL PROPERTIES THAT DISTINGUISH THEM FROM ACIDS AND OTHER CHEMICAL SUBSTANCES. UNDERSTANDING THESE CHARACTERISTICS IS CRUCIAL FOR IDENTIFYING AND UTILIZING BASES EFFECTIVELY.

TASTE AND FEEL

BASES OFTEN HAVE A BITTER TASTE AND A SLIPPERY OR SOAPY FEEL. THIS IS DUE TO THEIR REACTION WITH THE OILS ON OUR SKIN, SAPONIFYING THEM INTO A SOAP-LIKE SUBSTANCE. EXAMPLES OF THIS INCLUDE THE FEEL OF SOAP, WHICH IS TYPICALLY MADE FROM STRONG BASES REACTING WITH FATS. AS WITH ACIDS, TASTING OR TOUCHING UNKNOWN SUBSTANCES IS HIGHLY UNSAFE AND SHOULD BE AVOIDED.

REACTIONS WITH ACIDS

BASES REACT WITH ACIDS IN A PROCESS CALLED NEUTRALIZATION. THIS REACTION TYPICALLY PRODUCES A SALT AND WATER. FOR EXAMPLE, THE REACTION BETWEEN SODIUM HYDROXIDE (A BASE) AND HYDROCHLORIC ACID (AN ACID) YIELDS SODIUM CHLORIDE (A SALT) AND WATER: $\text{NaOH} + \text{HCl} \rightarrow \text{NaCl} + \text{H}_2\text{O}$. THIS NEUTRALIZATION REACTION IS A FUNDAMENTAL CONCEPT IN ACID-BASE CHEMISTRY.

REACTIONS WITH FATS AND OILS

BASES ARE EFFECTIVE AT BREAKING DOWN FATS AND OILS, A PROCESS KNOWN AS SAPONIFICATION. THIS IS WHY BASES ARE OFTEN USED IN SOAPS AND CLEANING AGENTS. THE BASE REACTS WITH THE FATTY ACIDS IN THE OIL TO FORM SOLUBLE SOAPS AND GLYCEROL. THIS PROPERTY MAKES THEM EXCELLENT FOR REMOVING GREASY STAINS AND RESIDUES.

CONDUCTIVITY

LIKE ACIDS, SOLUTIONS OF BASES IN WATER CONDUCT ELECTRICITY BECAUSE THEY DISSOCIATE INTO IONS. THE CONCENTRATION OF HYDROXIDE IONS IN THE SOLUTION DETERMINES THE ELECTRICAL CONDUCTIVITY. STRONG BASES, SUCH AS POTASSIUM HYDROXIDE, DISSOCIATE EXTENSIVELY, LEADING TO GOOD ELECTRICAL CONDUCTIVITY. WEAK BASES, LIKE AMMONIA, HAVE LIMITED DISSOCIATION AND THUS LOWER CONDUCTIVITY.

COMMON EXAMPLES OF BASES

NUMEROUS BASES ARE FOUND IN OUR ENVIRONMENT AND ARE INTEGRAL TO VARIOUS PROCESSES, BOTH NATURAL AND MAN-MADE. RECOGNIZING THESE COMMON BASES PROVIDES CONTEXT FOR THEIR WIDESPREAD APPLICATIONS.

- SODIUM HYDROXIDE (NaOH): ALSO KNOWN AS LYE, USED IN SOAP MAKING, DETERGENTS, AND DRAIN CLEANERS.
- POTASSIUM HYDROXIDE (KOH): USED IN SOAPS, BATTERIES, AND FERTILIZERS.
- CALCIUM HYDROXIDE (Ca(OH)_2): COMMONLY KNOWN AS SLAKED LIME, USED IN CONSTRUCTION AND WATER TREATMENT.
- AMMONIA (NH_3): USED AS A FERTILIZER, IN CLEANING PRODUCTS, AND IN THE PRODUCTION OF PLASTICS.
- MAGNESIUM HYDROXIDE (Mg(OH)_2): FOUND IN ANTACIDS AND LAXATIVES.
- SODIUM BICARBONATE (NaHCO_3): BAKING SODA, USED IN BAKING AND AS AN ANTACID.

THE PH SCALE: MEASURING ACIDITY AND BASICITY

THE PH SCALE IS A LOGARITHMIC SCALE USED TO SPECIFY THE ACIDITY OR BASICITY OF AN AQUEOUS SOLUTION. IT IS A CRUCIAL TOOL FOR QUANTIFYING HOW ACIDIC OR BASIC A SUBSTANCE IS. THE SCALE TYPICALLY RANGES FROM 0 TO 14, WITH 7 REPRESENTING A NEUTRAL SOLUTION.

UNDERSTANDING THE PH VALUE

THE PH VALUE IS DIRECTLY RELATED TO THE CONCENTRATION OF HYDROGEN IONS (H^+) IN A SOLUTION. SPECIFICALLY, PH IS DEFINED AS THE NEGATIVE LOGARITHM (BASE 10) OF THE HYDROGEN ION CONCENTRATION: $PH = -\log[H^+]$. A LOWER PH VALUE INDICATES A HIGHER CONCENTRATION OF H^+ IONS AND THEREFORE A MORE ACIDIC SOLUTION. CONVERSELY, A HIGHER PH VALUE SIGNIFIES A LOWER CONCENTRATION OF H^+ IONS AND A MORE BASIC SOLUTION.

INTERPRETING THE PH SCALE

A PH VALUE BELOW 7 INDICATES AN ACIDIC SOLUTION, WITH VALUES CLOSER TO 0 BEING STRONGLY ACIDIC. A PH VALUE ABOVE 7 INDICATES A BASIC (ALKALINE) SOLUTION, WITH VALUES CLOSER TO 14 BEING STRONGLY BASIC. A PH OF EXACTLY 7 SIGNIFIES A NEUTRAL SOLUTION, WHERE THE CONCENTRATION OF HYDROGEN IONS EQUALS THE CONCENTRATION OF HYDROXIDE IONS. FOR INSTANCE, PURE WATER HAS A PH OF 7.

THE POH SCALE

RELATED TO THE PH SCALE IS THE POH SCALE, WHICH MEASURES THE CONCENTRATION OF HYDROXIDE IONS (OH^-). THE RELATIONSHIP BETWEEN PH AND POH IS CONSTANT: $PH + POH = 14$ (AT $25^\circ C$). THIS ALLOWS FOR EASY CONVERSION BETWEEN THE TWO SCALES. IF A SOLUTION HAS A HIGH PH (IS BASIC), IT WILL HAVE A LOW POH, AND VICE VERSA.

ACID-BASE NEUTRALIZATION REACTIONS

NEUTRALIZATION REACTIONS ARE FUNDAMENTAL CHEMICAL PROCESSES THAT OCCUR WHEN AN ACID AND A BASE REACT WITH EACH OTHER. THESE REACTIONS ARE CHARACTERIZED BY THE COMBINATION OF ACIDIC AND BASIC PROPERTIES TO FORM A NEUTRAL SUBSTANCE.

THE PROCESS OF NEUTRALIZATION

IN A NEUTRALIZATION REACTION, THE HYDROGEN IONS (H^+) FROM THE ACID COMBINE WITH THE HYDROXIDE IONS (OH^-) FROM THE BASE TO FORM WATER (H_2O). THE REMAINING IONS FROM THE ACID AND BASE COMBINE TO FORM A SALT. FOR EXAMPLE, THE REACTION BETWEEN NITRIC ACID (HNO_3) AND POTASSIUM HYDROXIDE (KOH) PRODUCES POTASSIUM NITRATE (KNO_3), A SALT, AND WATER: $HNO_3 + KOH \rightarrow KNO_3 + H_2O$. THIS REACTION EFFECTIVELY CANCELS OUT THE ACIDIC AND BASIC PROPERTIES.

EXOTHERMIC NATURE OF NEUTRALIZATION

NEUTRALIZATION REACTIONS ARE TYPICALLY EXOTHERMIC, MEANING THEY RELEASE HEAT INTO THE SURROUNDINGS. THIS IS BECAUSE THE FORMATION OF WATER FROM H^+ AND OH^- IONS IS AN ENERGETICALLY FAVORABLE PROCESS. THE AMOUNT OF HEAT RELEASED DEPENDS ON THE STRENGTH OF THE ACID AND BASE INVOLVED, AS WELL AS THEIR CONCENTRATIONS.

TITRATION: A PRACTICAL APPLICATION

TITRATION IS A COMMON LABORATORY TECHNIQUE THAT UTILIZES NEUTRALIZATION REACTIONS TO DETERMINE THE CONCENTRATION OF AN UNKNOWN ACID OR BASE SOLUTION. BY CAREFULLY ADDING A SOLUTION OF KNOWN CONCENTRATION (THE TITRANT) TO A SOLUTION OF UNKNOWN CONCENTRATION UNTIL NEUTRALIZATION IS COMPLETE, ONE CAN CALCULATE THE CONCENTRATION OF THE UNKNOWN SUBSTANCE. THIS IS OFTEN INDICATED BY A COLOR CHANGE USING A PH INDICATOR.

ACIDS AND BASES IN EVERYDAY LIFE

ACIDS AND BASES ARE NOT CONFINED TO LABORATORIES; THEY ARE INTEGRAL COMPONENTS OF OUR DAILY LIVES, INFLUENCING EVERYTHING FROM DIGESTION TO CLEANING.

- **DIGESTION:** STOMACH ACID (HYDROCHLORIC ACID) IS CRUCIAL FOR BREAKING DOWN FOOD AND KILLING BACTERIA.

FREQUENTLY ASKED QUESTIONS

WHAT'S THE EASIEST WAY TO UNDERSTAND ACIDS AND BASES?

THINK OF ACIDS AS THINGS THAT TASTE SOUR AND BASES AS THINGS THAT TASTE BITTER. ACIDS MAKE SOLUTIONS HAVE MORE H^+ IONS, WHILE BASES MAKE SOLUTIONS HAVE MORE OH^- IONS. WATER IS NEUTRAL.

WHAT'S THE MOST COMMON EXAMPLE OF AN ACID?

LEMON JUICE AND VINEGAR ARE COMMON HOUSEHOLD ACIDS. THEY CONTAIN CITRIC ACID AND ACETIC ACID, RESPECTIVELY.

WHAT'S THE MOST COMMON EXAMPLE OF A BASE?

BAKING SODA AND SOAP ARE COMMON BASES. BAKING SODA IS A MILD BASE, WHILE MANY CLEANING PRODUCTS ARE STRONGER BASES.

WHAT DOES PH MEASURE?

PH MEASURES HOW ACIDIC OR BASIC A SOLUTION IS. A LOW PH (BELOW 7) MEANS ACIDIC, A HIGH PH (ABOVE 7) MEANS BASIC, AND 7 IS NEUTRAL.

WHAT HAPPENS WHEN AN ACID AND A BASE MIX?

WHEN AN ACID AND A BASE MIX, THEY NEUTRALIZE EACH OTHER. THIS REACTION FORMS SALT AND WATER, BRINGING THE PH CLOSER TO NEUTRAL.

ARE ALL ACIDS DANGEROUS?

NO, NOT ALL ACIDS ARE DANGEROUS. ACIDS LIKE THOSE FOUND IN FOOD ARE GENERALLY SAFE IN SMALL AMOUNTS. STRONG ACIDS, HOWEVER, CAN BE CORROSIVE AND DANGEROUS.

ARE ALL BASES DANGEROUS?

SIMILAR TO ACIDS, NOT ALL BASES ARE DANGEROUS. MILD BASES LIKE BAKING SODA ARE SAFE. STRONG BASES, LIKE DRAIN CLEANER, CAN BE VERY CORROSIVE AND HARMFUL.

WHAT'S THE DIFFERENCE BETWEEN A STRONG ACID/BASE AND A WEAK ACID/BASE?

STRONG ACIDS AND BASES COMPLETELY BREAK APART (DISSOCIATE) IN WATER, RELEASING LOTS OF H^+ OR OH^- IONS. WEAK ACIDS AND BASES ONLY PARTIALLY DISSOCIATE, RELEASING FEWER IONS.

HOW CAN I TELL IF SOMETHING IS ACIDIC OR BASIC WITHOUT TASTING IT?

YOU CAN USE PH PAPER OR A PH METER. PH PAPER CHANGES COLOR DEPENDING ON THE ACIDITY OR ALKALINITY OF THE SOLUTION.

WHY ARE ACIDS AND BASES IMPORTANT IN OUR BODIES?

ACIDS AND BASES ARE CRUCIAL FOR MANY BODILY FUNCTIONS, LIKE DIGESTION (STOMACH ACID) AND MAINTAINING THE CORRECT PH BALANCE IN OUR BLOOD TO KEEP CELLS WORKING PROPERLY.
