Frequently Asked Questions

What are the main differences between prokaryotic

and eukaryotic cells as discussed in Campbell Biology 11th edition?

Prokaryotic cells lack a true nucleus and other membrane-bound organelles, whereas eukaryotic cells have a true nucleus and various membrane-bound organelles, allowing for greater complexity and functionality.

How does photosynthesis occur in plants according to Campbell Biology 11th edition?

Photosynthesis occurs in specialized organelles called chloroplasts, where light energy is absorbed by pigments such as chlorophyll and used to convert carbon dioxide and water into glucose and oxygen.

What is the central dogma of molecular biology as explained in Campbell Biology 11th edition?

The central dogma states that genetic information flows from DNA to RNA to proteins, where DNA serves as the template for transcription of RNA, and RNA is then translated into proteins.

What are the key components of the cell cycle as described in Campbell Biology 11th edition?

The cell cycle consists of interphase (G1, S, and G2 phases) and the mitotic phase, where a cell grows, replicates its DNA, and divides into two daughter cells.

How do natural selection and genetic drift influence evolution as discussed in Campbell Biology 11th edition?

Natural selection acts on existing variation in a population, favoring individuals with traits that enhance survival and reproduction, whereas genetic drift involves random changes in allele frequencies, leading to the evolution of new species over time.
