Frequently Asked Questions

What is the main difference between a prokaryotic cell and a eukaryotic cell?

The main difference is that eukaryotic cells have a true nucleus and other membrane-bound organelles, whereas prokaryotic cells do not.

Which biologist is credited with the theory of endosymbiosis?

Lynn Margulis is credited with the theory of endosymbiosis, which proposes that some organelles in eukaryotic cells originated from symbiotic relationships with prokaryotic cells.

What is the primary function of the mitochondria in a cell?

The primary function of the mitochondria is to generate energy for the cell through the process of cellular respiration, producing ATP (adenosine triphosphate).

What is the difference between a haploid cell and a diploid cell?

A haploid cell has one set of chromosomes, while a diploid cell has two sets of chromosomes, one from each parent.

Which part of a cell is responsible for protein synthesis?

The ribosomes are responsible for protein synthesis, reading messenger RNA (mRNA) sequences and assembling amino acids into polypeptide chains.

What is the process by which water moves through a plant, from the roots to the leaves, and is then released into the air as water vapor?

The process is called transpiration, which is an important part of the water cycle and occurs mainly through structures called stomata on the surface of leaves.

What is the term for the 'building blocks of life'?

Cells are often referred to as the 'building blocks of life' because all living organisms are composed

of one or more cells, and cells are the basic structural and functional units of life.

Which scientist is credited with the discovery of the structure of DNA?
