Frequently Asked Questions

What is the main difference between prokaryotic and eukaryotic cells in Campbell Biology?

The main difference is that prokaryotic cells lack a true nucleus and other membrane-bound organelles, whereas eukaryotic cells have a true nucleus and other membrane-bound organelles.

How does photosynthesis occur in plants according to Campbell Biology?

Photosynthesis occurs in plants through the conversion of light energy from the sun into chemical energy in the form of glucose, using chlorophyll and other pigments to absorb light energy.

What is the purpose of mitosis in cell division as described in Campbell Biology?

The purpose of mitosis is to produce two daughter cells that are genetically identical to the parent cell, with the same number of chromosomes.

What is the difference between a haploid and diploid cell in Campbell Biology?

A haploid cell has one set of chromosomes, while a diploid cell has two sets of chromosomes, one from each parent.

How does natural selection act on populations according to Campbell Biology?

Natural selection acts on populations by favoring individuals with traits that are better suited to their environment, leading to an increase in the frequency of those traits over time.

What is the role of DNA replication in the cell cycle as described in Campbell Biology?

DNA replication is the process by which a cell makes an exact copy of its DNA before cell division, ensuring that the new cell receives a complete and accurate set of genetic

instructions.

What is the difference between a dominant and recessive allele in Campbell Biology?

A dominant allele will be expressed if an individual has one copy of the allele, while a recessive allele will only be expressed if an individual has two copies of the allele.

How do genes control the development and growth of an organism according to Campbell Biology?

Genes control the development and growth of an organism by providing instructions for the production of proteins, which in turn influence the development and function of cells and tissues.
