

CAMPBELL BIOLOGY CIRCULATORY SYSTEM EXPLAINED

UNDERSTANDING THE CIRCULATORY SYSTEM: A CAMPBELL BIOLOGY PERSPECTIVE

CAMPBELL BIOLOGY CIRCULATORY SYSTEM EXPLAINED IN INTRICATE DETAIL REVEALS A MARVEL OF BIOLOGICAL ENGINEERING, CRUCIAL FOR SUSTAINING LIFE. THIS VITAL NETWORK, COMPOSED OF THE HEART, BLOOD VESSELS, AND BLOOD, ENSURES THE EFFICIENT TRANSPORT OF OXYGEN, NUTRIENTS, HORMONES, AND WASTE PRODUCTS THROUGHOUT AN ORGANISM. FROM THE SINGLE-CELLED SIMPLICITY OF DIFFUSION TO THE COMPLEX, MULTI-CHAMBERED PUMPS OF VERTEBRATES, CAMPBELL BIOLOGY METICULOUSLY DISSECTS THE DIVERSE STRATEGIES LIFE EMPLOYS FOR CIRCULATION. UNDERSTANDING THE MECHANISMS OF BLOOD FLOW, THE COMPOSITION OF BLOOD, AND THE INTRICATE DANCE BETWEEN DIFFERENT CIRCULATORY COMPONENTS IS FUNDAMENTAL TO GRASPING OVERALL PHYSIOLOGICAL FUNCTION AND HEALTH. THIS ARTICLE WILL DELVE INTO THE CORE PRINCIPLES OF THE CIRCULATORY SYSTEM AS PRESENTED IN CAMPBELL BIOLOGY, EXPLORING ITS STRUCTURE, FUNCTION, AND EVOLUTIONARY ADAPTATIONS.

COMMON CIRCULATORY ISSUES AND HEALTH

THE FUNDAMENTALS OF CIRCULATORY SYSTEMS

AT ITS MOST BASIC, A CIRCULATORY SYSTEM IS A BIOLOGICAL NETWORK THAT FACILITATES THE MOVEMENT OF SUBSTANCES WITHIN AN ORGANISM. FOR UNICELLULAR ORGANISMS OR THOSE WITH VERY SIMPLE STRUCTURES, DIRECT DIFFUSION ACROSS THE CELL MEMBRANE OR THROUGH A GASTROVASCULAR CAVITY MAY SUFFICE. HOWEVER, AS ORGANISMS INCREASE IN SIZE AND COMPLEXITY, THE SURFACE AREA TO VOLUME RATIO DECREASES, MAKING DIFFUSION ALONE INSUFFICIENT TO MEET METABOLIC DEMANDS. THIS IS WHERE THE EVOLUTION OF DEDICATED CIRCULATORY SYSTEMS BECOMES ESSENTIAL.

CIRCULATORY SYSTEMS ARE BROADLY CATEGORIZED INTO TWO MAIN TYPES: OPEN AND CLOSED. THE DISTINCTION LIES IN WHETHER THE CIRCULATING FLUID, TYPICALLY CALLED HEMOLYMPH IN OPEN SYSTEMS, IS CONTAINED WITHIN VESSELS OR DIRECTLY BATHES THE TISSUES. OPEN CIRCULATORY SYSTEMS ARE FOUND IN MANY INVERTEBRATES, SUCH AS INSECTS AND MOLLUSKS, WHERE A HEART PUMPS HEMOLYMPH INTO SHORT VESSELS THAT OPEN INTO THE BODY CAVITY (HEMOCOEL). THE HEMOLYMPH THEN PERCOLATES THROUGH TISSUES BEFORE RETURNING TO THE HEART. CLOSED CIRCULATORY SYSTEMS, CHARACTERISTIC OF VERTEBRATES AND A FEW INVERTEBRATES LIKE ANNELIDS, FEATURE BLOOD THAT IS ALWAYS CONFINED WITHIN A CONTINUOUS NETWORK OF VESSELS.

COMPONENTS OF THE CIRCULATORY SYSTEM

REGARDLESS OF WHETHER THE SYSTEM IS OPEN OR CLOSED, SEVERAL KEY COMPONENTS WORK IN CONCERT TO ENSURE EFFECTIVE CIRCULATION. THE CENTRAL COMPONENT IS THE PUMP, MOST COMMONLY A HEART OR A SPECIALIZED MUSCULAR VESSEL, WHICH GENERATES THE FORCE NEEDED TO MOVE THE CIRCULATING FLUID. THE CIRCULATING FLUID ITSELF, WHETHER IT BE BLOOD OR HEMOLYMPH, ACTS AS THE TRANSPORT MEDIUM, CARRYING DISSOLVED GASES, NUTRIENTS, WASTE PRODUCTS, AND SIGNALING MOLECULES. FINALLY, A SYSTEM OF VESSELS, WHICH CAN RANGE FROM SIMPLE PORES TO COMPLEX ARTERIAL, VENOUS, AND CAPILLARY NETWORKS, DIRECTS THE FLOW OF THIS FLUID THROUGHOUT THE ORGANISM'S BODY.

THE HEART: THE POWERHOUSE OF CIRCULATION

THE HEART IS A MUSCULAR ORGAN THAT RHYTHMICALLY CONTRACTS TO PROPEL THE CIRCULATING FLUID. ITS STRUCTURE AND COMPLEXITY VARY SIGNIFICANTLY ACROSS THE ANIMAL KINGDOM. IN SIMPLER ORGANISMS, THE HEART MIGHT BE A SINGLE CHAMBERED STRUCTURE, WHILE IN MORE COMPLEX ANIMALS, IT CAN BE A HIGHLY SPECIALIZED ORGAN WITH MULTIPLE CHAMBERS. THESE CHAMBERS ARE DESIGNED TO RECEIVE DEOXYGENATED BLOOD, PUMP IT TO THE RESPIRATORY ORGANS FOR OXYGENATION, RECEIVE OXYGENATED BLOOD BACK FROM THE RESPIRATORY ORGANS, AND THEN PUMP IT TO THE REST OF THE BODY. THE COORDINATED CONTRACTIONS OF THESE CHAMBERS ARE ESSENTIAL FOR MAINTAINING BLOOD PRESSURE AND FLOW.

BLOOD VESSELS: THE HIGHWAYS OF TRANSPORT

BLOOD VESSELS FORM AN INTRICATE NETWORK THAT PERMEATES EVERY TISSUE AND ORGAN. IN CLOSED CIRCULATORY SYSTEMS, THREE MAIN TYPES OF VESSELS ARE DISTINGUISHED: ARTERIES, VEINS, AND CAPILLARIES. ARTERIES CARRY BLOOD AWAY FROM THE HEART, TYPICALLY UNDER HIGH PRESSURE, AND BRANCH INTO SMALLER ARTERIOLES. CAPILLARIES ARE THE SMALLEST VESSELS, FORMING EXTENSIVE NETWORKS WITHIN TISSUES. THEIR THIN WALLS (OFTEN A SINGLE LAYER OF ENDOTHELIAL CELLS) FACILITATE THE EXCHANGE OF GASES, NUTRIENTS, AND WASTE PRODUCTS BETWEEN THE BLOOD AND THE SURROUNDING CELLS. AFTER PASSING THROUGH CAPILLARIES, BLOOD COLLECTS IN VENULES, WHICH MERGE TO FORM LARGER VEINS THAT RETURN BLOOD TO THE HEART, USUALLY UNDER LOWER PRESSURE THAN ARTERIES.

THE CIRCULATING FLUID: BLOOD AND HEMOLYMPH

THE CIRCULATING FLUID IS THE MEDIUM RESPONSIBLE FOR TRANSPORTING VITAL SUBSTANCES. IN CLOSED SYSTEMS, THIS FLUID IS BLOOD, A COMPLEX CONNECTIVE TISSUE. BLOOD CONSISTS OF PLASMA, THE LIQUID MATRIX, AND VARIOUS TYPES OF CELLS SUSPENDED WITHIN IT, INCLUDING RED BLOOD CELLS (ERYTHROCYTES) FOR OXYGEN TRANSPORT, WHITE BLOOD CELLS (LEUKOCYTES) FOR IMMUNE DEFENSE, AND PLATELETS (THROMBOCYTES) FOR BLOOD CLOTTING. IN OPEN SYSTEMS, THE CIRCULATING FLUID IS HEMOLYMPH, WHICH IS SIMILAR TO BLOOD PLASMA BUT ALSO DIRECTLY BATHES THE TISSUES. HEMOLYMPH MAY CONTAIN HEMOCYTES, WHICH ARE ANALOGOUS TO WHITE BLOOD CELLS, AND SOMETIMES RESPIRATORY PIGMENTS FOR GAS TRANSPORT.

THE VERTEBRATE CIRCULATORY SYSTEM: A DEEPER DIVE

CAMPBELL BIOLOGY DEDICATES SIGNIFICANT ATTENTION TO THE VERTEBRATE CIRCULATORY SYSTEM DUE TO ITS PREVALENCE AND COMPLEXITY. THE EVOLUTION OF THE VERTEBRATE HEART SHOWCASES A PROGRESSIVE INCREASE IN THE NUMBER OF CHAMBERS, LEADING TO GREATER EFFICIENCY IN SEPARATING OXYGENATED AND DEOXYGENATED BLOOD. THIS SEPARATION IS CRITICAL FOR SUPPORTING HIGHER METABOLIC RATES CHARACTERISTIC OF ACTIVE, ENDOTHERMIC ANIMALS.

FISH: THE SINGLE CIRCULATION SYSTEM

FISH POSSESS A TWO-CHAMBERED HEART (ONE ATRIUM AND ONE VENTRICLE) THAT PUMPS DEOXYGENATED BLOOD TO THE GILLS FOR GAS EXCHANGE. FROM THE GILLS, OXYGENATED BLOOD THEN FLOWS DIRECTLY TO THE REST OF THE BODY BEFORE RETURNING TO THE HEART. THIS IS KNOWN AS A SINGLE CIRCULATION SYSTEM, CHARACTERIZED BY LOWER BLOOD PRESSURE AFTER PASSING THROUGH THE GILL CAPILLARIES.

AMPHIBIANS AND REPTILES: THE INCOMPLETE DOUBLE CIRCULATION

AMPHIBIANS AND MOST REPTILES HAVE A THREE-CHAMBERED HEART CONSISTING OF TWO ATRIA AND ONE VENTRICLE. THIS ARRANGEMENT ALLOWS FOR A DEGREE OF SEPARATION OF OXYGENATED AND DEOXYGENATED BLOOD, FORMING AN INCOMPLETE DOUBLE CIRCULATION. BLOOD IS PUMPED FROM THE VENTRICLE TO THE LUNGS AND SKIN (FOR GAS EXCHANGE) AND ALSO TO THE REST OF THE BODY. WHILE SOME MIXING OF OXYGENATED AND DEOXYGENATED BLOOD OCCURS IN THE SINGLE VENTRICLE, MECHANISMS EXIST TO SHUNT BLOOD PREFERENTIALLY TO THE LUNGS DURING SUBMERSION OR WHEN BREATHING IS REDUCED.

BIRDS AND MAMMALS: THE COMPLETE DOUBLE CIRCULATION SYSTEM

BIRDS AND MAMMALS HAVE ACHIEVED THE HIGHEST LEVEL OF CIRCULATORY EFFICIENCY WITH A FOUR-CHAMBERED HEART (TWO ATRIA AND TWO VENTRICLES). THIS COMPLETE DOUBLE CIRCULATION SYSTEM ENSURES THAT OXYGENATED AND DEOXYGENATED BLOOD ARE KEPT ENTIRELY SEPARATE. THE RIGHT SIDE OF THE HEART RECEIVES DEOXYGENATED BLOOD FROM THE BODY AND PUMPS IT TO THE LUNGS, WHILE THE LEFT SIDE RECEIVES OXYGENATED BLOOD FROM THE LUNGS AND PUMPS IT TO THE REST OF THE BODY. THIS EFFICIENT SEPARATION MAINTAINS HIGH BLOOD PRESSURE AND OXYGEN LEVELS, SUPPORTING THE HIGH METABOLIC DEMANDS OF ENDOTHERMY AND SUSTAINED ACTIVITY.

BLOOD: THE LIFEBLOOD OF CIRCULATION

BLOOD IS A DYNAMIC AND ESSENTIAL TISSUE, PLAYING A MULTIFACETED ROLE IN THE CIRCULATORY SYSTEM. ITS COMPOSITION IS FINELY TUNED TO PERFORM A VARIETY OF CRITICAL FUNCTIONS, MAKING IT FAR MORE THAN JUST A SIMPLE FLUID.

PLASMA: THE LIQUID MATRIX

PLASMA CONSTITUTES ABOUT 55% OF BLOOD VOLUME AND IS PRIMARILY WATER (ABOUT 92%). IT SERVES AS THE MEDIUM FOR TRANSPORTING DISSOLVED SUBSTANCES. KEY COMPONENTS OF PLASMA INCLUDE:

- **PROTEINS:** ALBUMIN (MAINTAINS OSMOTIC PRESSURE), GLOBULINS (ANTIBODIES, TRANSPORT PROTEINS), AND FIBRINOGEN (INVOLVED IN BLOOD CLOTTING).
- **ELECTROLYTES:** SODIUM, POTASSIUM, CALCIUM, CHLORIDE, AND BICARBONATE IONS, CRUCIAL FOR MAINTAINING FLUID BALANCE AND pH.
- **NUTRIENTS:** GLUCOSE, AMINO ACIDS, FATTY ACIDS, VITAMINS, AND MINERALS ABSORBED FROM THE DIGESTIVE SYSTEM.
- **WASTE PRODUCTS:** UREA, URIC ACID, AND CREATININE DESTINED FOR EXCRETION BY THE KIDNEYS.
- **HORMONES:** CHEMICAL MESSENGERS TRANSPORTED FROM ENDOCRINE GLANDS TO TARGET TISSUES.
- **GASES:** DISSOLVED OXYGEN AND CARBON DIOXIDE, THOUGH MOST ARE TRANSPORTED BY RED BLOOD CELLS.

CELLULAR COMPONENTS: THE WORKERS OF BLOOD

THE REMAINING 45% OF BLOOD VOLUME CONSISTS OF CELLULAR ELEMENTS, EACH WITH SPECIALIZED ROLES:

- **RED BLOOD CELLS (ERYTHROCYTES):** THESE BICONCAVE DISC-SHAPED CELLS ARE PACKED WITH HEMOGLOBIN, A PROTEIN THAT BINDS AND TRANSPORTS OXYGEN FROM THE LUNGS TO THE TISSUES AND ASSISTS IN CARRYING CARBON DIOXIDE BACK TO THE LUNGS.

- **WHITE BLOOD CELLS (LEUKOCYTES):** THESE CELLS ARE PART OF THE IMMUNE SYSTEM, DEFENDING THE BODY AGAINST PATHOGENS AND FOREIGN SUBSTANCES. VARIOUS TYPES OF WHITE BLOOD CELLS EXIST, INCLUDING NEUTROPHILS, LYMPHOCYTES, MONOCYTES, EOSINOPHILS, AND BASOPHILS, EACH WITH DISTINCT FUNCTIONS.
- **PLATELETS (THROMBOCYTES):** SMALL, IRREGULAR CELL FRAGMENTS THAT ARE ESSENTIAL FOR HEMOSTASIS, THE PROCESS OF BLOOD CLOTTING. THEY AGGREGATE AT THE SITE OF INJURY TO FORM A PLUG AND RELEASE FACTORS THAT INITIATE THE CLOTTING CASCADE.

REGULATION OF CIRCULATORY FUNCTION

THE CIRCULATORY SYSTEM DOES NOT OPERATE IN ISOLATION; ITS FUNCTION IS PRECISELY REGULATED TO MEET THE BODY'S CHANGING NEEDS. THIS REGULATION INVOLVES BOTH INTRINSIC (LOCAL) AND EXTRINSIC (NERVOUS AND ENDOCRINE) MECHANISMS.

AUTOREGULATION AND LOCAL CONTROL

MANY TISSUES CAN REGULATE THEIR OWN BLOOD FLOW BASED ON LOCAL METABOLIC DEMANDS. FOR INSTANCE, DURING EXERCISE, MUSCLES REQUIRE MORE OXYGEN AND NUTRIENTS, AND THEIR BLOOD VESSELS DILATE TO INCREASE BLOOD SUPPLY. THIS IS OFTEN ACHIEVED THROUGH THE RELEASE OF LOCAL CHEMICAL MEDIATORS SUCH AS NITRIC OXIDE OR BY CHANGES IN THE CONCENTRATION OF METABOLIC BYPRODUCTS LIKE CARBON DIOXIDE AND LACTIC ACID. THE MYOGENIC RESPONSE, A PROPERTY OF VASCULAR SMOOTH MUSCLE TO CONTRACT OR RELAX IN RESPONSE TO CHANGES IN BLOOD PRESSURE, ALSO CONTRIBUTES TO LOCAL BLOOD FLOW REGULATION.

NERVOUS SYSTEM CONTROL

THE AUTONOMIC NERVOUS SYSTEM PLAYS A SIGNIFICANT ROLE IN CONTROLLING HEART RATE, CONTRACTILITY, AND BLOOD VESSEL DIAMETER. THE SYMPATHETIC NERVOUS SYSTEM GENERALLY INCREASES HEART RATE AND CONSTRICTS BLOOD VESSELS, LEADING TO AN INCREASE IN BLOOD PRESSURE AND FLOW TO ESSENTIAL ORGANS DURING STRESS OR ACTIVITY (THE "FIGHT-OR-FLIGHT" RESPONSE). THE PARASYMPATHETIC NERVOUS SYSTEM, CONVERSELY, SLOWS HEART RATE AND DILATES BLOOD VESSELS, PROMOTING RELAXATION AND CONSERVING ENERGY.

HORMONAL CONTROL

SEVERAL HORMONES INFLUENCE THE CIRCULATORY SYSTEM. ADRENALINE (EPINEPHRINE) AND NORADRENALINE (NOREPINEPHRINE) FROM THE ADRENAL MEDULLA HAVE EFFECTS SIMILAR TO SYMPATHETIC STIMULATION, INCREASING HEART RATE AND BLOOD PRESSURE. ANTIDIURETIC HORMONE (ADH) CAN CAUSE VASOCONSTRICTION, RAISING BLOOD PRESSURE. ATRIAL NATRIURETIC PEPTIDE (ANP), RELEASED BY THE HEART'S ATRIA, PROMOTES VASODILATION AND SODIUM EXCRETION, LEADING TO A DECREASE IN BLOOD PRESSURE. ALDOSTERONE, PRODUCED BY THE ADRENAL CORTEX, INFLUENCES SODIUM AND WATER RETENTION, INDIRECTLY AFFECTING BLOOD VOLUME AND PRESSURE.

COMMON CIRCULATORY ISSUES AND HEALTH

UNDERSTANDING THE INTRICACIES OF THE CIRCULATORY SYSTEM ALSO SHEDS LIGHT ON COMMON HEALTH PROBLEMS THAT CAN ARISE WHEN ITS FUNCTION IS COMPROMISED. THESE ISSUES OFTEN STEM FROM STRUCTURAL DEFECTS, IMBALANCES IN BLOOD COMPOSITION, OR FAILURES IN REGULATORY MECHANISMS.

CARDIOVASCULAR DISEASES, SUCH AS ATHEROSCLEROSIS (HARDENING OF THE ARTERIES), HYPERTENSION (HIGH BLOOD PRESSURE), HEART ATTACKS, AND STROKES, ARE MAJOR PUBLIC HEALTH CONCERNS. THESE CONDITIONS OFTEN INVOLVE DAMAGE TO BLOOD VESSELS, IMPAIRED HEART FUNCTION, OR ABNORMALITIES IN BLOOD CLOTTING. CONDITIONS LIKE ANEMIA, CHARACTERIZED BY A DEFICIENCY IN RED BLOOD CELLS OR HEMOGLOBIN, IMPAIR THE BLOOD'S OXYGEN-CARRYING CAPACITY, LEADING TO FATIGUE AND REDUCED ORGAN FUNCTION. LEUKEMIA, A TYPE OF CANCER AFFECTING WHITE BLOOD CELLS, DISRUPTS THE IMMUNE SYSTEM AND CAN INTERFERE WITH NORMAL BLOOD CELL PRODUCTION. MAINTAINING A HEALTHY LIFESTYLE, INCLUDING A BALANCED DIET, REGULAR EXERCISE, AND AVOIDING SMOKING, IS CRUCIAL FOR SUPPORTING OPTIMAL CIRCULATORY HEALTH.

THE INTRICATE DESIGN AND DYNAMIC REGULATION OF THE CIRCULATORY SYSTEM, AS DETAILED WITHIN CAMPBELL BIOLOGY, UNDERSCORE ITS VITAL ROLE IN MAINTAINING HOMEOSTASIS AND ENABLING THE COMPLEX LIFE PROCESSES WE OBSERVE. FROM THE FUNDAMENTAL PRINCIPLES OF FLUID TRANSPORT TO THE SPECIALIZED ADAPTATIONS SEEN ACROSS DIVERSE ORGANISMS, A THOROUGH UNDERSTANDING OF THIS SYSTEM IS PARAMOUNT FOR COMPREHENDING THE ENTIRETY OF BIOLOGICAL FUNCTION.

FAQ

Q: WHAT ARE THE MAIN COMPONENTS OF THE CIRCULATORY SYSTEM AS EXPLAINED IN CAMPBELL BIOLOGY?

A: CAMPBELL BIOLOGY EXPLAINS THE CIRCULATORY SYSTEM AS BEING COMPRISED OF A PUMP (THE HEART), A CIRCULATING FLUID (BLOOD OR HEMOLYMPH), AND A NETWORK OF VESSELS (ARTERIES, VEINS, CAPILLARIES). THESE COMPONENTS WORK TOGETHER TO TRANSPORT OXYGEN, NUTRIENTS, HORMONES, AND WASTE PRODUCTS THROUGHOUT THE ORGANISM.

Q: HOW DOES THE CIRCULATORY SYSTEM OF A FISH DIFFER FROM THAT OF A MAMMAL?

A: FISH POSSESS A SINGLE CIRCULATION SYSTEM WITH A TWO-CHAMBERED HEART, WHERE BLOOD PASSES THROUGH THE HEART ONLY ONCE PER COMPLETE CIRCUIT. MAMMALS, ON THE OTHER HAND, HAVE A COMPLETE DOUBLE CIRCULATION SYSTEM WITH A FOUR-CHAMBERED HEART, ENSURING THAT OXYGENATED AND DEOXYGENATED BLOOD ARE KEPT SEPARATE AND THAT BLOOD PASSES THROUGH THE HEART TWICE PER CIRCUIT, LEADING TO HIGHER EFFICIENCY.

Q: WHAT IS THE ROLE OF RED BLOOD CELLS IN THE CIRCULATORY SYSTEM?

A: RED BLOOD CELLS, OR ERYTHROCYTES, ARE PRIMARILY RESPONSIBLE FOR OXYGEN TRANSPORT. THEY CONTAIN HEMOGLOBIN, A PROTEIN THAT BINDS TO OXYGEN IN THE LUNGS AND DELIVERS IT TO THE BODY'S TISSUES. THEY ALSO PLAY A ROLE IN TRANSPORTING A PORTION OF CARBON DIOXIDE BACK TO THE LUNGS.

Q: HOW DOES THE NERVOUS SYSTEM REGULATE BLOOD FLOW?

A: THE AUTONOMIC NERVOUS SYSTEM, SPECIFICALLY THE SYMPATHETIC AND PARASYMPATHETIC DIVISIONS, REGULATES BLOOD FLOW BY INFLUENCING HEART RATE, THE FORCE OF HEART CONTRACTION, AND THE DIAMETER OF BLOOD VESSELS. THE SYMPATHETIC NERVOUS SYSTEM GENERALLY CONSTRICTS VESSELS AND INCREASES HEART RATE, WHILE THE PARASYMPATHETIC SYSTEM HAS THE OPPOSITE EFFECTS.

Q: WHAT ARE CAPILLARIES AND WHY ARE THEY IMPORTANT?

A: CAPILLARIES ARE THE SMALLEST BLOOD VESSELS, FORMING EXTENSIVE NETWORKS WITHIN TISSUES. THEIR EXTREMELY THIN WALLS, OFTEN ONLY ONE CELL THICK, ARE CRUCIAL FOR FACILITATING THE EXCHANGE OF GASES, NUTRIENTS, WASTE PRODUCTS, AND HORMONES BETWEEN THE BLOOD AND THE SURROUNDING CELLS OF THE BODY.

Q: WHAT IS ATHEROSCLEROSIS AND HOW DOES IT AFFECT THE CIRCULATORY SYSTEM?

A: ATHEROSCLEROSIS IS A CONDITION CHARACTERIZED BY THE BUILDUP OF PLAQUE (FATS, CHOLESTEROL, AND OTHER SUBSTANCES) INSIDE THE ARTERIES. THIS BUILDUP NARROWS THE ARTERIES, RESTRICTS BLOOD FLOW, AND CAN LEAD TO SERIOUS PROBLEMS SUCH AS HEART ATTACKS AND STROKES.

Q: HOW DO HORMONES AFFECT THE CIRCULATORY SYSTEM?

A: HORMONES LIKE ADRENALINE CAN INCREASE HEART RATE AND CONSTRICT BLOOD VESSELS, RAISING BLOOD PRESSURE. OTHER HORMONES, SUCH AS ATRIAL NATRIURETIC PEPTIDE (ANP), CAN CAUSE VASODILATION AND REDUCE BLOOD PRESSURE BY PROMOTING SODIUM AND WATER EXCRETION.

Q: WHAT IS THE DIFFERENCE BETWEEN AN OPEN AND A CLOSED CIRCULATORY SYSTEM?

A: IN A CLOSED CIRCULATORY SYSTEM, BLOOD IS CONTAINED WITHIN A CONTINUOUS NETWORK OF VESSELS. IN CONTRAST, AN OPEN CIRCULATORY SYSTEM HAS A LESS COMPLEX SYSTEM WHERE THE CIRCULATING FLUID (HEMOLYMPH) IS PUMPED BY A HEART INTO OPEN SPACES OR SINUSES WITHIN THE BODY CAVITY, DIRECTLY BATHING THE ORGANS AND TISSUES.
