

CARBON SEQUESTRATION FOR CLIMATE ACTION

THE ROLE OF CARBON SEQUESTRATION FOR CLIMATE ACTION

CARBON SEQUESTRATION FOR CLIMATE ACTION IS RAPIDLY EMERGING AS A CRITICAL COMPONENT IN THE GLOBAL EFFORT TO MITIGATE THE DEVASTATING IMPACTS OF CLIMATE CHANGE. AS ATMOSPHERIC CARBON DIOXIDE (CO₂) LEVELS CONTINUE TO RISE, DRIVEN PRIMARILY BY HUMAN ACTIVITIES, UNDERSTANDING AND IMPLEMENTING EFFECTIVE CARBON SEQUESTRATION STRATEGIES BECOMES PARAMOUNT. THIS COMPREHENSIVE ARTICLE DELVES INTO THE MULTIFACETED WORLD OF CARBON SEQUESTRATION, EXPLORING ITS SCIENTIFIC UNDERPINNINGS, DIVERSE METHODS, ECONOMIC IMPLICATIONS, AND THE VITAL ROLE IT PLAYS IN ACHIEVING AMBITIOUS CLIMATE GOALS. WE WILL EXAMINE BOTH NATURAL AND TECHNOLOGICAL APPROACHES, HIGHLIGHTING THEIR POTENTIAL AND CHALLENGES IN THE ONGOING BATTLE AGAINST GLOBAL WARMING.

POLICY AND ECONOMIC CONSIDERATIONS

UNDERSTANDING CARBON SEQUESTRATION

CARBON SEQUESTRATION REFERS TO THE PROCESS OF CAPTURING AND STORING ATMOSPHERIC CARBON DIOXIDE (CO₂). THIS NATURAL OR ARTIFICIAL PROCESS IS DESIGNED TO REDUCE THE AMOUNT OF CO₂ IN THE ATMOSPHERE, THEREBY MITIGATING GLOBAL WARMING AND ITS ASSOCIATED CLIMATE CHANGE IMPACTS. CO₂ IS A POTENT GREENHOUSE GAS, AND ITS ACCUMULATION IN THE ATMOSPHERE TRAPS HEAT, LEADING TO RISING GLOBAL TEMPERATURES, SEA-LEVEL RISE, AND MORE EXTREME WEATHER EVENTS. BY ACTIVELY REMOVING CO₂ OR ENHANCING NATURAL SINKS THAT ABSORB IT, CARBON SEQUESTRATION OFFERS A CRUCIAL PATHWAY FOR CLIMATE ACTION.

THE EARTH'S CARBON CYCLE IS A COMPLEX BIOGEOCHEMICAL PROCESS THAT INVOLVES THE EXCHANGE OF CARBON ATOMS BETWEEN THE ATMOSPHERE, OCEANS, LAND, AND LIVING ORGANISMS. NATURAL SEQUESTRATION OCCURS CONTINUOUSLY AS PLANTS ABSORB CO₂ DURING PHOTOSYNTHESIS, AND IT IS STORED IN THEIR BIOMASS. WHEN ORGANISMS DIE, THIS CARBON CAN BE TRANSFERRED TO SOILS AND SEDIMENTS, BECOMING PART OF GEOLOGICAL RESERVOIRS OVER GEOLOGICAL TIMESCALES. UNDERSTANDING THESE NATURAL FLUXES IS FOUNDATIONAL TO DEVELOPING EFFECTIVE STRATEGIES FOR AUGMENTING CARBON REMOVAL.

NATURAL CARBON SEQUESTRATION METHODS

NATURE HAS LONG BEEN THE PRIMARY REGULATOR OF ATMOSPHERIC CARBON. HARNESSING AND ENHANCING THESE NATURAL PROCESSES OFFERS A SUSTAINABLE AND OFTEN COST-EFFECTIVE APPROACH TO CARBON SEQUESTRATION. THESE METHODS LEVERAGE THE EARTH'S BIOLOGICAL AND GEOLOGICAL SYSTEMS TO DRAW DOWN CO₂.

AFFORESTATION AND REFORESTATION

PLANTING NEW FORESTS (AFFORESTATION) AND RESTORING DEGRADED OR DEFORESTED AREAS (REFORESTATION) ARE AMONG THE MOST WELL-KNOWN AND EFFECTIVE NATURAL CARBON SEQUESTRATION METHODS. TREES ABSORB CO₂ FROM THE ATMOSPHERE THROUGH PHOTOSYNTHESIS, CONVERTING IT INTO ORGANIC MATTER AND STORING IT IN THEIR WOOD, LEAVES, AND ROOTS. THE SOIL BENEATH FORESTS ALSO ACTS AS A SIGNIFICANT CARBON SINK, ACCUMULATING CARBON FROM DECAYING

PLANT MATERIAL.

THE EFFECTIVENESS OF THESE METHODS DEPENDS ON FACTORS SUCH AS THE SPECIES OF TREES PLANTED, THE HEALTH OF THE ECOSYSTEM, AND THE DURATION FOR WHICH THE FORESTS REMAIN INTACT. SUSTAINABLE FOREST MANAGEMENT PRACTICES ARE CRUCIAL TO ENSURE LONG-TERM CARBON STORAGE AND TO PREVENT EMISSIONS FROM DEFORESTATION OR DEGRADATION.

SOIL CARBON SEQUESTRATION

SOILS ARE A VAST RESERVOIR OF CARBON, HOLDING MORE CARBON THAN THE ATMOSPHERE AND ALL VEGETATION COMBINED. PRACTICES THAT IMPROVE SOIL HEALTH CAN SIGNIFICANTLY ENHANCE ITS CAPACITY TO SEQUESTER CARBON. THESE PRACTICES OFTEN INVOLVE INCREASING ORGANIC MATTER CONTENT IN THE SOIL.

KEY METHODS FOR ENHANCING SOIL CARBON SEQUESTRATION INCLUDE:

- NO-TILL OR REDUCED TILLAGE FARMING: MINIMIZING SOIL DISTURBANCE PRESERVES SOIL STRUCTURE AND ORGANIC MATTER.
- COVER CROPPING: PLANTING NON-CASH CROPS BETWEEN MAIN GROWING SEASONS PROTECTS THE SOIL SURFACE AND ADDS ORGANIC MATTER.
- CROP ROTATION: DIVERSIFYING CROPS GROWN IN A FIELD CAN IMPROVE SOIL HEALTH AND NUTRIENT CYCLING.
- COMPOSTING AND ORGANIC AMENDMENTS: ADDING COMPOST OR OTHER ORGANIC MATERIALS TO THE SOIL BOOSTS ITS CARBON CONTENT.
- AGROFORESTRY: INTEGRATING TREES WITH CROPS AND LIVESTOCK CAN ENHANCE CARBON STORAGE IN BOTH BIOMASS AND SOIL.

OCEAN CARBON SEQUESTRATION

THE OCEANS PLAY A MONUMENTAL ROLE IN THE GLOBAL CARBON CYCLE, ABSORBING A SIGNIFICANT PORTION OF THE CO₂ EMITTED BY HUMAN ACTIVITIES. THIS ABSORPTION OCCURS THROUGH TWO MAIN PROCESSES: THE SOLUBILITY PUMP AND THE BIOLOGICAL PUMP.

THE SOLUBILITY PUMP IS A PHYSICAL PROCESS WHERE CO₂ DISSOLVES DIRECTLY FROM THE ATMOSPHERE INTO SURFACE WATERS. AS SURFACE WATERS COOL AND SINK, THEY TRANSPORT THIS DISSOLVED CO₂ TO THE DEEP OCEAN. THE BIOLOGICAL PUMP INVOLVES MARINE ORGANISMS, PARTICULARLY PHYTOPLANKTON, WHICH TAKE UP CO₂ THROUGH PHOTOSYNTHESIS. WHEN THESE ORGANISMS DIE OR ARE CONSUMED, THEIR ORGANIC MATTER SINKS TO THE OCEAN FLOOR, SEQUESTERING CARBON. EFFORTS ARE BEING EXPLORED TO ENHANCE THESE NATURAL OCEANIC SINKS, THOUGH THEY COME WITH ECOLOGICAL CONSIDERATIONS.

TECHNOLOGICAL CARBON SEQUESTRATION SOLUTIONS

WHILE NATURAL METHODS ARE VITAL, TECHNOLOGICAL SOLUTIONS OFFER ADDITIONAL PATHWAYS FOR CARBON CAPTURE AND STORAGE, PARTICULARLY FOR INDUSTRIAL EMISSIONS. THESE METHODS AIM TO DIRECTLY CAPTURE CO₂ FROM POINT SOURCES OR FROM THE AMBIENT AIR.

CARBON CAPTURE AND STORAGE (CCS)

CARBON CAPTURE AND STORAGE (CCS) IS A SUITE OF TECHNOLOGIES DESIGNED TO CAPTURE CO₂ EMISSIONS FROM LARGE POINT SOURCES, SUCH AS POWER PLANTS AND INDUSTRIAL FACILITIES, AND THEN STORE IT PERMANENTLY UNDERGROUND. THIS PROCESS TYPICALLY INVOLVES THREE MAIN STAGES: CAPTURE, TRANSPORT, AND STORAGE.

THE CAPTURE STAGE INVOLVES SEPARATING CO₂ FROM OTHER GASES PRODUCED DURING INDUSTRIAL PROCESSES. THIS CAN BE DONE USING PRE-COMBUSTION CAPTURE, POST-COMBUSTION CAPTURE, OR OXY-FUEL COMBUSTION. ONCE CAPTURED, THE CO₂ IS COMPRESSED INTO A LIQUID OR SUPERCRITICAL STATE AND TRANSPORTED, USUALLY VIA PIPELINES, TO A SUITABLE GEOLOGICAL STORAGE SITE. STORAGE OPTIONS INCLUDE DEEP SALINE AQUIFERS, DEPLETED OIL AND GAS RESERVOIRS, OR UNMINEABLE COAL SEAMS. ENSURING THE INTEGRITY OF THESE STORAGE SITES IS CRUCIAL TO PREVENT CO₂ LEAKAGE BACK INTO THE ATMOSPHERE.

DIRECT AIR CAPTURE (DAC)

DIRECT AIR CAPTURE (DAC) TECHNOLOGIES AIM TO REMOVE CO₂ DIRECTLY FROM THE AMBIENT ATMOSPHERE, IRRESPECTIVE OF THE SOURCE. THIS APPROACH IS CONSIDERED A CRUCIAL COMPONENT OF NEGATIVE EMISSIONS TECHNOLOGIES (NETS), WHICH ARE NEEDED TO ACHIEVE AMBITIOUS CLIMATE TARGETS BY NOT ONLY REDUCING EMISSIONS BUT ALSO REMOVING LEGACY CO₂ FROM THE AIR.

DAC SYSTEMS TYPICALLY USE CHEMICAL PROCESSES TO ABSORB CO₂ FROM THE AIR. ONCE CAPTURED, THE CO₂ CAN BE EITHER STORED UNDERGROUND (DACCS – DIRECT AIR CAPTURE WITH CARBON STORAGE) OR UTILIZED IN VARIOUS PRODUCTS, SUCH AS SYNTHETIC FUELS, BUILDING MATERIALS, OR ENHANCED OIL RECOVERY (THOUGH THE LATTER IS CONTROVERSIAL). WHILE DAC OFFERS SIGNIFICANT POTENTIAL, IT IS CURRENTLY ENERGY-INTENSIVE AND EXPENSIVE, REQUIRING FURTHER TECHNOLOGICAL ADVANCEMENT AND SCALING.

BIOENERGY WITH CARBON CAPTURE AND STORAGE (BECCS)

BIOENERGY WITH CARBON CAPTURE AND STORAGE (BECCS) IS ANOTHER NET THAT COMBINES THE USE OF BIOMASS FOR ENERGY PRODUCTION WITH CCS TECHNOLOGY. BIOMASS, SUCH AS AGRICULTURAL WASTE OR DEDICATED ENERGY CROPS, ABSORBS CO₂ FROM THE ATMOSPHERE AS IT GROWS. WHEN THIS BIOMASS IS BURNED FOR ENERGY, THE RESULTING CO₂ EMISSIONS ARE CAPTURED AND STORED UNDERGROUND, RESULTING IN A NET REMOVAL OF CO₂ FROM THE ATMOSPHERE.

BECCS IS CONSIDERED A PROMISING TECHNOLOGY FOR ACHIEVING NEGATIVE EMISSIONS. HOWEVER, ITS SCALABILITY AND SUSTAINABILITY ARE SUBJECTS OF ONGOING DEBATE. CONCERNS INCLUDE THE LAND USE REQUIRED FOR BIOMASS CULTIVATION, POTENTIAL IMPACTS ON FOOD SECURITY, AND THE OVERALL LIFE CYCLE EMISSIONS OF THE PROCESS. CAREFUL PLANNING AND RESPONSIBLE IMPLEMENTATION ARE ESSENTIAL.

BENEFITS OF CARBON SEQUESTRATION FOR CLIMATE ACTION

THE IMPLEMENTATION OF EFFECTIVE CARBON SEQUESTRATION STRATEGIES YIELDS A MULTITUDE OF BENEFITS ESSENTIAL FOR A SUSTAINABLE FUTURE. THESE BENEFITS EXTEND BEYOND JUST ATMOSPHERIC CO₂ REDUCTION TO ENCOMPASS ENVIRONMENTAL, ECONOMIC, AND SOCIAL ADVANTAGES.

PRIMARY AMONG THESE BENEFITS IS THE DIRECT CONTRIBUTION TO CLIMATE CHANGE MITIGATION. BY REDUCING THE CONCENTRATION OF GREENHOUSE GASES IN THE ATMOSPHERE, CARBON SEQUESTRATION HELPS TO:

- SLOW DOWN THE RATE OF GLOBAL WARMING.

- REDUCE THE FREQUENCY AND INTENSITY OF EXTREME WEATHER EVENTS LIKE HEATWAVES, DROUGHTS, FLOODS, AND STORMS.
- LIMIT SEA-LEVEL RISE AND PROTECT COASTAL COMMUNITIES.
- PRESERVE BIODIVERSITY AND PREVENT ECOSYSTEM COLLAPSE.
- REDUCE THE ACIDIFICATION OF OCEANS, WHICH HARMS MARINE LIFE.

BEYOND CLIMATE MITIGATION, CARBON SEQUESTRATION CAN ALSO FOSTER ECONOMIC OPPORTUNITIES. THE DEVELOPMENT AND DEPLOYMENT OF SEQUESTRATION TECHNOLOGIES CREATE NEW INDUSTRIES, JOBS, AND MARKETS FOR CARBON CREDITS. FURTHERMORE, IMPROVING SOIL HEALTH THROUGH SEQUESTRATION PRACTICES CAN LEAD TO INCREASED AGRICULTURAL PRODUCTIVITY, REDUCED RELIANCE ON SYNTHETIC FERTILIZERS, AND ENHANCED WATER RETENTION, PROVIDING FARMERS WITH ECONOMIC RESILIENCE.

CHALLENGES AND FUTURE OF CARBON SEQUESTRATION

DESPITE ITS IMMENSE POTENTIAL, WIDESPREAD ADOPTION OF CARBON SEQUESTRATION FACES SEVERAL SIGNIFICANT CHALLENGES. OVERCOMING THESE HURDLES IS CRUCIAL FOR REALIZING ITS FULL IMPACT ON CLIMATE ACTION.

ONE OF THE PRIMARY CHALLENGES IS COST. MANY CARBON CAPTURE TECHNOLOGIES, PARTICULARLY DAC, ARE CURRENTLY EXPENSIVE TO DEPLOY AT SCALE. WHILE COSTS ARE DECREASING WITH TECHNOLOGICAL ADVANCEMENTS AND INCREASED DEPLOYMENT, SIGNIFICANT INVESTMENT IS STILL REQUIRED. FURTHERMORE, THE ENERGY REQUIREMENTS FOR SOME CAPTURE PROCESSES CAN BE SUBSTANTIAL, NECESSITATING THE USE OF RENEWABLE ENERGY SOURCES TO AVOID OFFSETTING THE CLIMATE BENEFITS.

ANOTHER MAJOR CHALLENGE IS THE LONG-TERM SECURITY AND MONITORING OF STORED CARBON. FOR GEOLOGICAL SEQUESTRATION, ENSURING THAT STORED CO₂ REMAINS PERMANENTLY UNDERGROUND WITHOUT LEAKAGE IS PARAMOUNT. THIS REQUIRES ROBUST SITE SELECTION, RIGOROUS MONITORING PROTOCOLS, AND REGULATORY FRAMEWORKS. THE PUBLIC PERCEPTION AND ACCEPTANCE OF UNDERGROUND CO₂ STORAGE ALSO PLAY A ROLE.

LOOKING AHEAD, THE FUTURE OF CARBON SEQUESTRATION FOR CLIMATE ACTION HINGES ON CONTINUED RESEARCH AND DEVELOPMENT, SUPPORTIVE POLICY FRAMEWORKS, AND INCREASED GLOBAL COLLABORATION. INNOVATION IN CAPTURE TECHNOLOGIES, IMPROVED STORAGE SOLUTIONS, AND ENHANCED NATURAL SEQUESTRATION METHODS WILL BE KEY. POLICIES THAT INCENTIVIZE CARBON REMOVAL, SUCH AS CARBON PRICING MECHANISMS AND TAX CREDITS, CAN DRIVE INVESTMENT AND DEPLOYMENT. FURTHERMORE, INTEGRATING VARIOUS SEQUESTRATION APPROACHES—NATURAL, TECHNOLOGICAL, AND A COMBINATION OF BOTH—WILL LIKELY BE NECESSARY TO ACHIEVE THE AMBITIOUS EMISSIONS REDUCTION TARGETS REQUIRED TO LIMIT GLOBAL WARMING TO SAFE LEVELS.

POLICY AND ECONOMIC CONSIDERATIONS

THE SUCCESSFUL IMPLEMENTATION OF CARBON SEQUESTRATION STRATEGIES IS INTRINSICALLY LINKED TO EFFECTIVE POLICY AND SOUND ECONOMIC FRAMEWORKS. GOVERNMENTS AND INTERNATIONAL BODIES PLAY A CRUCIAL ROLE IN CREATING AN ENVIRONMENT THAT SUPPORTS THE DEVELOPMENT, DEPLOYMENT, AND LONG-TERM VIABILITY OF THESE SOLUTIONS.

ECONOMIC INCENTIVES ARE VITAL FOR DRIVING INVESTMENT IN CARBON SEQUESTRATION. MECHANISMS SUCH AS CARBON TAXES, CAP-AND-TRADE SYSTEMS, AND TAX CREDITS FOR CARBON CAPTURE PROJECTS CAN MAKE SEQUESTRATION ECONOMICALLY ATTRACTIVE. THESE POLICIES INTERNALIZE THE COST OF CARBON EMISSIONS, ENCOURAGING BUSINESSES AND INDUSTRIES TO INVEST IN REDUCING THEIR CARBON FOOTPRINT THROUGH CAPTURE AND STORAGE. THE DEVELOPMENT OF ROBUST CARBON MARKETS, WHERE THE CAPTURE AND STORAGE OF CO₂ CAN BE QUANTIFIED AND TRADED, IS ALSO ESSENTIAL FOR CREATING

FINANCIAL INCENTIVES.

REGULATORY FRAMEWORKS ARE EQUALLY IMPORTANT. CLEAR GUIDELINES AND STANDARDS FOR CARBON CAPTURE, TRANSPORT, AND STORAGE ARE NEEDED TO ENSURE SAFETY, ENVIRONMENTAL INTEGRITY, AND LONG-TERM EFFICACY. THESE REGULATIONS SHOULD ADDRESS ISSUES SUCH AS SITE SELECTION CRITERIA FOR GEOLOGICAL STORAGE, MONITORING REQUIREMENTS TO DETECT AND PREVENT LEAKS, AND LIABILITY FOR POTENTIAL ENVIRONMENTAL DAMAGE. PUBLIC TRUST AND ACCEPTANCE ARE BUILT UPON TRANSPARENT AND RIGOROUS REGULATORY OVERSIGHT.

FAQ: CARBON SEQUESTRATION FOR CLIMATE ACTION

Q: WHAT IS THE PRIMARY GOAL OF CARBON SEQUESTRATION IN THE CONTEXT OF CLIMATE ACTION?

A: THE PRIMARY GOAL OF CARBON SEQUESTRATION FOR CLIMATE ACTION IS TO REDUCE THE CONCENTRATION OF ATMOSPHERIC CARBON DIOXIDE (CO₂), A MAJOR GREENHOUSE GAS, THEREBY MITIGATING GLOBAL WARMING AND ITS ASSOCIATED ADVERSE EFFECTS. THIS INVOLVES EITHER REMOVING CO₂ FROM THE ATMOSPHERE OR PREVENTING IT FROM ENTERING IN THE FIRST PLACE.

Q: HOW DO NATURAL METHODS OF CARBON SEQUESTRATION DIFFER FROM TECHNOLOGICAL METHODS?

A: NATURAL METHODS LEVERAGE BIOLOGICAL AND GEOLOGICAL PROCESSES, SUCH AS PHOTOSYNTHESIS BY PLANTS, SOIL ORGANIC MATTER ACCUMULATION, AND OCEAN ABSORPTION, TO SEQUESTER CARBON. TECHNOLOGICAL METHODS, CONVERSELY, INVOLVE ENGINEERED SYSTEMS LIKE CARBON CAPTURE AND STORAGE (CCS) FROM INDUSTRIAL SOURCES AND DIRECT AIR CAPTURE (DAC) SYSTEMS THAT DIRECTLY REMOVE CO₂ FROM THE AMBIENT AIR.

Q: WHAT ARE THE MAIN BENEFITS OF IMPLEMENTING AFFORESTATION AND REFORESTATION PROGRAMS FOR CLIMATE ACTION?

A: AFFORESTATION AND REFORESTATION OFFER SIGNIFICANT BENEFITS BY INCREASING THE EARTH'S NATURAL CARBON SINKS. TREES ABSORB SUBSTANTIAL AMOUNTS OF CO₂ AS THEY GROW, STORING IT IN THEIR BIOMASS AND THE SURROUNDING SOIL. THESE PROGRAMS ALSO CONTRIBUTE TO BIODIVERSITY CONSERVATION, SOIL HEALTH IMPROVEMENT, AND WATER CYCLE REGULATION, PROVIDING MULTIFACETED ENVIRONMENTAL ADVANTAGES.

Q: WHAT ARE THE KEY CHALLENGES ASSOCIATED WITH DEPLOYING CARBON CAPTURE AND STORAGE (CCS) TECHNOLOGIES?

A: KEY CHALLENGES FOR CCS INCLUDE THE HIGH CAPITAL COSTS ASSOCIATED WITH CAPTURE EQUIPMENT, THE ENERGY INTENSITY OF THE CAPTURE PROCESS, THE NEED FOR SECURE AND SUITABLE GEOLOGICAL STORAGE SITES, AND THE LONG-TERM MONITORING REQUIRED TO ENSURE NO LEAKAGE. TRANSPORTATION INFRASTRUCTURE FOR THE CAPTURED CO₂ ALSO PRESENTS LOGISTICAL HURDLES.

Q: HOW DOES DIRECT AIR CAPTURE (DAC) TECHNOLOGY CONTRIBUTE TO CLIMATE ACTION, AND WHAT ARE ITS CURRENT LIMITATIONS?

A: DAC CONTRIBUTES TO CLIMATE ACTION BY DIRECTLY REMOVING CO₂ FROM THE ATMOSPHERE, OFFERING A PATHWAY FOR NEGATIVE EMISSIONS. ITS LIMITATIONS INCLUDE HIGH OPERATIONAL COSTS, SIGNIFICANT ENERGY REQUIREMENTS, AND THE NEED FOR FURTHER TECHNOLOGICAL DEVELOPMENT TO IMPROVE EFFICIENCY AND SCALABILITY, MAKING IT A PROMISING BUT STILL DEVELOPING SOLUTION.

Q: CAN CARBON SEQUESTRATION ALONE SOLVE THE CLIMATE CRISIS, OR IS IT PART OF A LARGER STRATEGY?

A: CARBON SEQUESTRATION ALONE IS NOT SUFFICIENT TO SOLVE THE CLIMATE CRISIS. IT IS A VITAL COMPONENT OF A BROADER CLIMATE ACTION STRATEGY THAT MUST ALSO INCLUDE AGGRESSIVE REDUCTIONS IN GREENHOUSE GAS EMISSIONS FROM ALL SECTORS, A TRANSITION TO RENEWABLE ENERGY SOURCES, AND IMPROVEMENTS IN ENERGY EFFICIENCY. SEQUESTRATION HELPS ADDRESS RESIDUAL EMISSIONS AND HISTORICAL CO₂.

Q: WHAT ROLE DO POLICIES AND ECONOMIC INCENTIVES PLAY IN PROMOTING CARBON SEQUESTRATION?

A: POLICIES AND ECONOMIC INCENTIVES ARE CRUCIAL FOR DRIVING THE ADOPTION OF CARBON SEQUESTRATION. MECHANISMS LIKE CARBON PRICING, TAX CREDITS, AND SUBSIDIES CAN MAKE SEQUESTRATION PROJECTS FINANCIALLY VIABLE, ENCOURAGING INVESTMENT AND INNOVATION. CLEAR REGULATORY FRAMEWORKS ALSO ENSURE SAFETY, TRANSPARENCY, AND PUBLIC TRUST IN THESE TECHNOLOGIES AND PRACTICES.

Q: ARE THERE ANY RISKS ASSOCIATED WITH STORING CAPTURED CARBON UNDERGROUND?

A: YES, THERE ARE POTENTIAL RISKS ASSOCIATED WITH STORING CAPTURED CARBON UNDERGROUND, PRIMARILY CONCERNING LEAKAGE. IF STORAGE SITES ARE NOT PROPERLY SELECTED, ENGINEERED, OR MONITORED, CO₂ COULD ESCAPE BACK INTO THE ATMOSPHERE, NEGATING THE CLIMATE BENEFITS. GEOLOGICAL STABILITY AND THE INTEGRITY OF THE CAPROCK ARE CRITICAL FACTORS TO PREVENT SUCH LEAKAGE.
