

CAUSAL INFERENCE OBSERVATIONAL STUDIES

THE POWER AND PITFALLS OF CAUSAL INFERENCE IN OBSERVATIONAL STUDIES

CAUSAL INFERENCE OBSERVATIONAL STUDIES PRESENTS A FORMIDABLE CHALLENGE IN FIELDS RANGING FROM EPIDEMIOLOGY AND ECONOMICS TO SOCIAL SCIENCES AND MARKETING. WHILE RANDOMIZED CONTROLLED TRIALS (RCTs) ARE THE GOLD STANDARD FOR ESTABLISHING CAUSALITY, THEY ARE OFTEN INFEASIBLE, UNETHICAL, OR PROHIBITIVELY EXPENSIVE. THIS NECESSITATES RELIANCE ON OBSERVATIONAL DATA, WHERE RESEARCHERS ANALYZE NATURALLY OCCURRING PHENOMENA WITHOUT DIRECT MANIPULATION. THE CORE OBJECTIVE THEN BECOMES DISENTANGLING CORRELATION FROM CAUSATION, A COMPLEX ENDEAVOR DEMANDING RIGOROUS METHODOLOGIES AND CAREFUL INTERPRETATION. THIS ARTICLE DELVES INTO THE INTRICACIES OF APPLYING CAUSAL INFERENCE TECHNIQUES TO OBSERVATIONAL DATA, EXPLORING COMMON CHALLENGES, PREVALENT METHODS, AND CRUCIAL CONSIDERATIONS FOR DRAWING RELIABLE CONCLUSIONS ABOUT CAUSE-AND-EFFECT RELATIONSHIPS. WE WILL NAVIGATE THE LANDSCAPE OF POTENTIAL OUTCOMES, CONFOUNDING VARIABLES, AND THE VARIOUS STATISTICAL APPROACHES EMPLOYED TO OVERCOME THE INHERENT LIMITATIONS OF OBSERVATIONAL RESEARCH.

UNDERSTANDING CAUSAL INFERENCE IN OBSERVATIONAL SETTINGS

CAUSAL INFERENCE, IN ESSENCE, IS THE PROCESS OF DETERMINING WHETHER A SPECIFIC EXPOSURE OR INTERVENTION ACTUALLY CAUSES AN OUTCOME, RATHER THAN MERELY BEING ASSOCIATED WITH IT. WHEN DEALING WITH OBSERVATIONAL STUDIES, RESEARCHERS ARE NOT ACTIVELY ASSIGNING TREATMENTS OR EXPOSURES. INSTEAD, THEY OBSERVE INDIVIDUALS OR UNITS AS THEY NATURALLY FALL INTO DIFFERENT GROUPS BASED ON CERTAIN CHARACTERISTICS OR BEHAVIORS. THIS MEANS THAT ANY OBSERVED ASSOCIATION BETWEEN AN EXPOSURE AND AN OUTCOME COULD BE DUE TO A MYRIAD OF OTHER FACTORS THAT DIFFER BETWEEN THE EXPOSED AND UNEXPOSED GROUPS, A PHENOMENON KNOWN AS CONFOUNDING. THE PRIMARY GOAL OF CAUSAL INFERENCE IN THIS CONTEXT IS TO ISOLATE THE TRUE EFFECT OF THE EXPOSURE FROM THESE EXTRANEOUS INFLUENCES.

THE ALLURE OF OBSERVATIONAL DATA LIES IN ITS UBIQUITY AND ITS ABILITY TO REFLECT REAL-WORLD CONDITIONS. WE CAN STUDY THE LONG-TERM EFFECTS OF SMOKING, THE IMPACT OF ECONOMIC POLICIES ON POPULATION HEALTH, OR THE EFFECTIVENESS OF EDUCATIONAL INTERVENTIONS IN NATURAL SETTINGS. HOWEVER, THE ABSENCE OF RANDOMIZATION IS A CRITICAL DISTINCTION FROM EXPERIMENTAL DESIGNS. IN AN RCT, PARTICIPANTS ARE RANDOMLY ASSIGNED TO TREATMENT OR CONTROL GROUPS, ENSURING THAT, ON AVERAGE, THE GROUPS ARE SIMILAR ACROSS ALL OBSERVABLE AND UNOBSERVABLE CHARACTERISTICS. THIS BASELINE COMPARABILITY IS WHAT ALLOWS FOR STRAIGHTFORWARD INTERPRETATION OF DIFFERENCES IN OUTCOMES AS CAUSAL EFFECTS. OBSERVATIONAL STUDIES, BY CONTRAST, LACK THIS BUILT-IN BALANCE, MAKING THE TASK OF CAUSAL INFERENCE SIGNIFICANTLY MORE DEMANDING.

THE FUNDAMENTAL PROBLEM OF CAUSAL INFERENCE

AT THE HEART OF CAUSAL INFERENCE LIES THE FUNDAMENTAL PROBLEM: WE CAN NEVER OBSERVE BOTH POTENTIAL OUTCOMES

FOR THE SAME UNIT AT THE SAME TIME. FOR ANY INDIVIDUAL, WE CAN ONLY OBSERVE WHAT HAPPENS WHEN THEY RECEIVE THE TREATMENT (OR EXPOSURE) OR WHAT HAPPENS WHEN THEY DO NOT. WE CANNOT SIMULTANEOUSLY KNOW WHAT WOULD HAVE HAPPENED TO THEM UNDER THE ALTERNATIVE SCENARIO. THIS IS OFTEN REFERRED TO AS THE "COUNTERFACTUAL" PROBLEM. FOR INSTANCE, IF WE OBSERVE A PERSON WHO SMOKED AND SUBSEQUENTLY DEVELOPED LUNG CANCER, WE CAN NEVER KNOW FOR SURE WHETHER THAT SAME PERSON WOULD HAVE DEVELOPED LUNG CANCER IF THEY HAD NOT SMOKED. THE DEVELOPMENT OF LUNG CANCER IN THE ABSENCE OF SMOKING IS THEIR COUNTERFACTUAL OUTCOME, WHICH IS UNOBSERVABLE.

BECAUSE OF THIS FUNDAMENTAL LIMITATION, CAUSAL INFERENCE IN OBSERVATIONAL STUDIES RELIES ON MAKING ASSUMPTIONS THAT ALLOW US TO ESTIMATE THE COUNTERFACTUAL OUTCOME. THESE ASSUMPTIONS AIM TO CREATE, OR APPROXIMATE, THE CONDITIONS OF A RANDOMIZED EXPERIMENT USING STATISTICAL METHODS. THE VALIDITY OF ANY CAUSAL CONCLUSION DRAWN FROM OBSERVATIONAL DATA HINGES ENTIRELY ON THE TENABILITY OF THESE UNDERLYING ASSUMPTIONS. IF THE ASSUMPTIONS ARE VIOLATED, THE ESTIMATED CAUSAL EFFECT WILL LIKELY BE BIASED, LEADING TO INCORRECT INFERENCES.

KEY CONCEPTS IN OBSERVATIONAL CAUSAL INFERENCE

SEVERAL CORE CONCEPTS ARE INDISPENSABLE FOR UNDERSTANDING AND CONDUCTING CAUSAL INFERENCE IN OBSERVATIONAL SETTINGS. THESE CONCEPTS PROVIDE THE THEORETICAL UNDERPINNINGS FOR THE METHODOLOGIES USED TO OVERCOME THE FUNDAMENTAL PROBLEM AND ADDRESS CONFOUNDING.

CONFOUNDING VARIABLES

CONFOUNDING IS PERHAPS THE MOST SIGNIFICANT HURDLE IN OBSERVATIONAL CAUSAL INFERENCE. A CONFOUNDER IS A VARIABLE THAT IS ASSOCIATED WITH BOTH THE EXPOSURE AND THE OUTCOME, AND IT DISTORTS THE ESTIMATED RELATIONSHIP BETWEEN THEM. FOR EXAMPLE, IN A STUDY EXAMINING THE EFFECT OF A NEW TEACHING METHOD ON STUDENT TEST SCORES, SOCIOECONOMIC STATUS (SES) COULD BE A CONFOUNDER. IF STUDENTS FROM HIGHER SES BACKGROUNDS ARE MORE LIKELY TO BE EXPOSED TO THE NEW TEACHING METHOD AND ALSO TEND TO PERFORM BETTER ACADEMICALLY REGARDLESS OF THE TEACHING METHOD, THEN ANY OBSERVED IMPROVEMENT IN TEST SCORES MIGHT BE ATTRIBUTED TO SES RATHER THAN THE TEACHING METHOD ITSELF.

TREATMENT ASSIGNMENT MECHANISM

UNDERSTANDING HOW INDIVIDUALS ARE ASSIGNED TO TREATMENT OR EXPOSURE GROUPS IS CRUCIAL. IN OBSERVATIONAL STUDIES, THIS ASSIGNMENT IS NOT RANDOM. IT CAN BE INFLUENCED BY A HOST OF FACTORS, INCLUDING INDIVIDUAL CHOICES, DOCTOR'S DECISIONS, OR SYSTEMATIC BIASES. RESEARCHERS NEED TO METICULOUSLY INVESTIGATE AND MODEL THIS ASSIGNMENT MECHANISM TO IDENTIFY POTENTIAL SOURCES OF BIAS AND TO APPLY APPROPRIATE STATISTICAL ADJUSTMENTS. THE STRONGER AND MORE SYSTEMATIC THE NON-RANDOM ASSIGNMENT, THE MORE CHALLENGING CAUSAL INFERENCE BECOMES.

POTENTIAL OUTCOMES FRAMEWORK

THE POTENTIAL OUTCOMES FRAMEWORK, POPULARIZED BY DONALD RUBIN, PROVIDES A FORMAL WAY TO DEFINE CAUSAL EFFECTS. FOR EACH UNIT, THERE IS A POTENTIAL OUTCOME UNDER TREATMENT ($Y(1)$) AND A POTENTIAL OUTCOME UNDER CONTROL ($Y(0)$). THE CAUSAL EFFECT FOR THAT UNIT IS THE DIFFERENCE $Y(1) - Y(0)$. SINCE WE ONLY OBSERVE ONE OF THESE, WE ARE INTERESTED IN AVERAGE CAUSAL EFFECTS ACROSS A POPULATION, SUCH AS THE AVERAGE TREATMENT EFFECT (ATE) OR THE AVERAGE TREATMENT EFFECT ON THE TREATED (ATT).

EXCHANGEABILITY AND IGNORABILITY

THESE CONCEPTS ARE CENTRAL TO MAKING CAUSAL CLAIMS FROM OBSERVATIONAL DATA. EXCHANGEABILITY (OR CONDITIONAL EXCHANGEABILITY) MEANS THAT, CONDITIONAL ON A SET OF OBSERVED COVARIATES, THE TREATMENT ASSIGNMENT IS INDEPENDENT OF THE POTENTIAL OUTCOMES. IN SIMPLER TERMS, IT MEANS THAT THE GROUPS BEING COMPARED ARE SIMILAR ON AVERAGE WITH RESPECT TO THE FACTORS THAT INFLUENCE THE OUTCOME. IGNORABILITY IS A CLOSELY RELATED ASSUMPTION STATING THAT THE TREATMENT ASSIGNMENT MECHANISM IS UNRELATED TO THE POTENTIAL OUTCOMES, GIVEN THE OBSERVED COVARIATES. THIS ASSUMPTION IS OFTEN TERMED "UNCONFOUNDEDNESS" OR "NO UNMEASURED CONFOUNDING."

COMMON CHALLENGES IN OBSERVATIONAL STUDIES

BEYOND THE FUNDAMENTAL PROBLEM, OBSERVATIONAL STUDIES ARE PLAGUED BY A VARIETY OF CHALLENGES THAT CAN COMPROMISE THE VALIDITY OF CAUSAL INFERENCES. RECOGNIZING THESE PITFALLS IS THE FIRST STEP TOWARDS MITIGATING THEIR IMPACT.

SELECTION BIAS

SELECTION BIAS ARISES WHEN THE SAMPLE OF INDIVIDUALS STUDIED IS NOT REPRESENTATIVE OF THE POPULATION OF INTEREST, OR WHEN THE SELECTION PROCESS INTO THE STUDY OR INTO DIFFERENT TREATMENT GROUPS IS RELATED TO THE OUTCOME. THIS CAN OCCUR IF, FOR EXAMPLE, INDIVIDUALS WHO ARE SICKER ARE MORE LIKELY TO SEEK OUT A PARTICULAR TREATMENT, LEADING TO AN APPARENT ASSOCIATION BETWEEN THE TREATMENT AND POOR OUTCOMES, EVEN IF THE TREATMENT ITSELF IS BENEFICIAL.

MEASUREMENT ERROR

INACCURATE MEASUREMENT OF EXPOSURES, OUTCOMES, OR COVARIATES CAN INTRODUCE BIAS. IF A KEY VARIABLE IS SYSTEMATICALLY MISCLASSIFIED, IT CAN ATTENUATE OR EVEN REVERSE THE TRUE CAUSAL EFFECT. FOR INSTANCE, IF RECALL BIAS LEADS PARTICIPANTS TO UNDERREPORT PAST EXPOSURES, THE ESTIMATED EFFECT OF THOSE EXPOSURES MAY BE BIASED.

TIME-VARYING CONFOUNDERS

IN LONGITUDINAL OBSERVATIONAL STUDIES, CONFOUNDERS CAN CHANGE OVER TIME AND BE AFFECTED BY PRIOR TREATMENT. THESE ARE KNOWN AS TIME-VARYING CONFOUNDERS. FAILING TO ACCOUNT FOR THEM APPROPRIATELY CAN LEAD TO SUBSTANTIAL BIAS, OFTEN REQUIRING SOPHISTICATED STATISTICAL METHODS LIKE MARGINAL STRUCTURAL MODELS.

LACK OF COMPARABILITY

EVEN AFTER CONTROLLING FOR OBSERVABLE CONFOUNDERS, THERE IS ALWAYS THE POSSIBILITY OF UNMEASURED CONFOUNDING. THIS REFERS TO UNOBSERVED VARIABLES THAT ARE ASSOCIATED WITH BOTH THE EXPOSURE AND THE OUTCOME. THIS IS A PERSISTENT LIMITATION OF MOST OBSERVATIONAL STUDIES AND NECESSITATES CAREFUL CONSIDERATION OF THE PLAUSIBILITY OF SUCH UNMEASURED CONFOUNDERS.

METHODOLOGIES FOR CAUSAL INFERENCE IN OBSERVATIONAL DATA

A VARIETY OF STATISTICAL TECHNIQUES HAVE BEEN DEVELOPED TO ADDRESS CONFOUNDING AND OTHER BIASES IN OBSERVATIONAL STUDIES, ALLOWING RESEARCHERS TO APPROXIMATE THE CONDITIONS OF A RANDOMIZED EXPERIMENT.

PROPENSITY SCORE METHODS

PROPENSITY SCORE METHODS ARE A WIDELY USED SET OF TECHNIQUES FOR DEALING WITH CONFOUNDING IN OBSERVATIONAL STUDIES. THE PROPENSITY SCORE IS THE PROBABILITY OF RECEIVING THE TREATMENT, GIVEN A SET OF OBSERVED COVARIATES. IT IS TYPICALLY ESTIMATED USING LOGISTIC REGRESSION.

- **MATCHING:** UNITS WITH SIMILAR PROPENSITY SCORES ARE MATCHED. THIS CREATES MATCHED PAIRS OR GROUPS WHERE THE DISTRIBUTION OF OBSERVED COVARIATES IS SIMILAR BETWEEN TREATED AND UNTREATED INDIVIDUALS.
- **STRATIFICATION:** THE SAMPLE IS DIVIDED INTO STRATA (E.G., QUINTILES) BASED ON PROPENSITY SCORES. CAUSAL EFFECTS ARE THEN ESTIMATED WITHIN EACH STRATUM AND POOLED.
- **INVERSE PROBABILITY OF TREATMENT WEIGHTING (IPTW):** INDIVIDUALS ARE WEIGHTED BY THE INVERSE OF THEIR PROPENSITY SCORE. THIS CREATES A PSEUDO-POPULATION WHERE TREATMENT ASSIGNMENT IS INDEPENDENT OF THE OBSERVED COVARIATES, MIMICKING RANDOMIZATION.
- **PROPENSITY SCORE ADJUSTMENT:** THE PROPENSITY SCORE ITSELF CAN BE USED AS A COVARIATE IN REGRESSION MODELS TO ADJUST FOR CONFOUNDING.

INSTRUMENTAL VARIABLES (IV)

INSTRUMENTAL VARIABLES ARE VARIABLES THAT ARE CORRELATED WITH THE TREATMENT OF INTEREST BUT DO NOT DIRECTLY AFFECT THE OUTCOME, EXCEPT THROUGH THEIR INFLUENCE ON THE TREATMENT. AN INSTRUMENT ACTS LIKE A NATURAL EXPERIMENT, RANDOMLY ASSIGNING SOME INDIVIDUALS TO THE TREATMENT GROUP. FOR EXAMPLE, A POLICY CHANGE THAT RANDOMLY AFFECTS THE AVAILABILITY OF A TREATMENT ACROSS DIFFERENT REGIONS COULD SERVE AS AN INSTRUMENTAL VARIABLE FOR THE EFFECT OF THAT TREATMENT.

REGRESSION DISCONTINUITY DESIGN (RDD)

RDD IS USED WHEN TREATMENT ASSIGNMENT IS DETERMINED BY WHETHER AN OBSERVED VARIABLE CROSSES A SPECIFIC THRESHOLD. FOR INSTANCE, IF A SCHOLARSHIP IS AWARDED TO STUDENTS SCORING ABOVE A CERTAIN GRADE POINT AVERAGE (GPA), THEN COMPARING STUDENTS JUST ABOVE AND JUST BELOW THE CUTOFF GPA ALLOWS FOR ESTIMATION OF THE CAUSAL EFFECT OF THE SCHOLARSHIP. THE ASSUMPTION IS THAT INDIVIDUALS JUST AROUND THE CUTOFF ARE SIMILAR IN ALL OTHER RESPECTS, MAKING THE ASSIGNMENT EFFECTIVELY RANDOM AT THE THRESHOLD.

DIFFERENCE-IN-DIFFERENCES (DiD)

DiD IS A QUASI-EXPERIMENTAL METHOD USED TO ESTIMATE THE CAUSAL EFFECT OF AN INTERVENTION BY COMPARING THE CHANGE IN OUTCOMES OVER TIME FOR A TREATMENT GROUP WITH THE CHANGE IN OUTCOMES OVER TIME FOR A CONTROL GROUP. IT REQUIRES DATA FROM BEFORE AND AFTER THE INTERVENTION FOR BOTH GROUPS. THE KEY ASSUMPTION IS THE "PARALLEL

TRENDS" ASSUMPTION, WHICH STATES THAT IN THE ABSENCE OF THE INTERVENTION, THE TREATMENT AND CONTROL GROUPS WOULD HAVE FOLLOWED SIMILAR TRENDS IN THE OUTCOME.

SENSITIVITY ANALYSIS AND ROBUSTNESS CHECKS

GIVEN THE INHERENT LIMITATIONS OF OBSERVATIONAL DATA, IT IS CRUCIAL TO CONDUCT SENSITIVITY ANALYSES. THESE ANALYSES EXPLORE HOW ROBUST THE STUDY FINDINGS ARE TO POTENTIAL VIOLATIONS OF KEY ASSUMPTIONS, PARTICULARLY THE ASSUMPTION OF NO UNMEASURED CONFOUNDING. BY ASSESSING HOW STRONG AN UNMEASURED CONFOUNDER WOULD NEED TO BE TO OVERTURN THE STUDY'S CONCLUSIONS, RESEARCHERS CAN PROVIDE A MORE NUANCED INTERPRETATION OF THEIR RESULTS.

BEST PRACTICES FOR CONDUCTING OBSERVATIONAL CAUSAL INFERENCE

DRAWING CREDIBLE CAUSAL CONCLUSIONS FROM OBSERVATIONAL DATA REQUIRES ADHERENCE TO RIGOROUS METHODOLOGICAL STANDARDS AND A DEEP UNDERSTANDING OF THE RESEARCH CONTEXT. RESEARCHERS MUST BE PROACTIVE IN ADDRESSING POTENTIAL BIASES AND TRANSPARENT IN THEIR REPORTING.

- **CLEARLY DEFINE CAUSAL QUESTIONS:** FORMULATE PRECISE RESEARCH QUESTIONS THAT ARE AMENABLE TO CAUSAL INFERENCE. SPECIFY THE EXPOSURE, THE OUTCOME, AND THE TARGET POPULATION.
- **COMPREHENSIVE LITERATURE REVIEW:** THOROUGHLY UNDERSTAND EXISTING RESEARCH, INCLUDING KNOWN CONFOUNDERS AND POTENTIAL BIASES IN THE FIELD.
- **DOMAIN EXPERTISE:** COLLABORATE WITH SUBJECT MATTER EXPERTS TO IDENTIFY RELEVANT CONFOUNDERS AND UNDERSTAND THE DATA-GENERATING PROCESS.
- **DETAILED DATA DOCUMENTATION:** MAINTAIN METICULOUS RECORDS OF DATA SOURCES, VARIABLE DEFINITIONS, AND ANY DATA CLEANING OR TRANSFORMATION STEPS.
- **PRE-SPECIFICATION OF METHODS:** WHENEVER POSSIBLE, PRE-SPECIFY THE ANALYTICAL METHODS TO BE USED BEFORE DATA ANALYSIS BEGINS TO AVOID P-HACKING AND DATA DREDGING.
- **MODEL DIAGNOSTICS:** RIGOROUSLY CHECK THE ASSUMPTIONS UNDERLYING CHOSEN STATISTICAL METHODS. FOR PROPENSITY SCORE METHODS, THIS INCLUDES CHECKING FOR OVERLAP IN PROPENSITY SCORES AND BALANCE IN COVARIATES AFTER MATCHING OR WEIGHTING.
- **TRANSPARENCY IN REPORTING:** CLEARLY REPORT ALL ASSUMPTIONS MADE, METHODS USED, LIMITATIONS OF THE STUDY, AND THE RESULTS OF SENSITIVITY ANALYSES.

THE PURSUIT OF CAUSAL INFERENCE FROM OBSERVATIONAL DATA IS AN ONGOING SCIENTIFIC ENDEAVOR. WHILE THE CHALLENGES ARE SUBSTANTIAL, THE DEVELOPMENT AND REFINEMENT OF SOPHISTICATED STATISTICAL TECHNIQUES, COUPLED WITH A COMMITMENT TO TRANSPARENCY AND RIGOROUS METHODOLOGY, EMPOWER RESEARCHERS TO GAIN VALUABLE INSIGHTS INTO CAUSE-AND-EFFECT RELATIONSHIPS THAT WOULD OTHERWISE REMAIN HIDDEN.

FAQ

Q: WHAT IS THE PRIMARY DIFFERENCE BETWEEN CAUSAL INFERENCE IN RANDOMIZED CONTROLLED TRIALS (RCTs) AND OBSERVATIONAL STUDIES?

A: THE PRIMARY DIFFERENCE LIES IN THE METHOD OF TREATMENT ASSIGNMENT. IN RCTs, TREATMENT IS RANDOMLY ASSIGNED, ENSURING THAT GROUPS ARE COMPARABLE ON AVERAGE, THUS DIRECTLY ATTRIBUTING OUTCOME DIFFERENCES TO THE TREATMENT. IN OBSERVATIONAL STUDIES, TREATMENT ASSIGNMENT IS NOT RANDOM; RESEARCHERS OBSERVE EXISTING EXPOSURES, REQUIRING STATISTICAL METHODS TO ACCOUNT FOR CONFOUNDING AND OTHER BIASES TO ESTIMATE CAUSAL EFFECTS.

Q: WHAT IS CONFOUNDING, AND WHY IS IT SUCH A SIGNIFICANT PROBLEM IN OBSERVATIONAL CAUSAL INFERENCE?

A: CONFOUNDING OCCURS WHEN A VARIABLE IS ASSOCIATED WITH BOTH THE EXPOSURE AND THE OUTCOME, LEADING TO A SPURIOUS ASSOCIATION BETWEEN THE EXPOSURE AND OUTCOME. IT IS A SIGNIFICANT PROBLEM BECAUSE IT MEANS AN OBSERVED CORRELATION MAY NOT REFLECT A TRUE CAUSAL EFFECT, BUT RATHER THE INFLUENCE OF THE CONFOUNDING VARIABLE.

Q: CAN PROPENSITY SCORES FULLY ELIMINATE CONFOUNDING IN OBSERVATIONAL STUDIES?

A: PROPENSITY SCORES CAN EFFECTIVELY CONTROL FOR CONFOUNDING DUE TO OBSERVED COVARIATES. HOWEVER, THEY CANNOT ADDRESS CONFOUNDING BY UNOBSERVED VARIABLES. IF THERE ARE UNMEASURED FACTORS THAT INFLUENCE BOTH TREATMENT ASSIGNMENT AND THE OUTCOME, PROPENSITY SCORE METHODS WILL NOT FULLY ELIMINATE BIAS.

Q: WHAT IS THE "PARALLEL TRENDS" ASSUMPTION IN DIFFERENCE-IN-DIFFERENCES (DiD) ANALYSIS?

A: THE PARALLEL TRENDS ASSUMPTION IS THE CORE ASSUMPTION IN DiD ANALYSIS. IT POSITS THAT, IN THE ABSENCE OF THE INTERVENTION OR TREATMENT, THE OUTCOME VARIABLE IN THE TREATMENT GROUP WOULD HAVE FOLLOWED THE SAME TREND AS THE OUTCOME VARIABLE IN THE CONTROL GROUP. IF THIS ASSUMPTION HOLDS, THE OBSERVED DIFFERENCE IN CHANGES OVER TIME CAN BE ATTRIBUTED TO THE INTERVENTION.

Q: HOW DOES AN INSTRUMENTAL VARIABLE (IV) HELP IN ESTABLISHING CAUSALITY FROM OBSERVATIONAL DATA?

A: AN INSTRUMENTAL VARIABLE ACTS AS A SURROGATE FOR RANDOMIZATION. IT MUST BE CORRELATED WITH THE TREATMENT OF INTEREST, UNRELATED TO THE OUTCOME EXCEPT THROUGH THE TREATMENT, AND NOT SHARE COMMON CAUSES WITH THE OUTCOME (OTHER THAN THROUGH THE TREATMENT). BY EXPLOITING THE VARIATION IN THE TREATMENT INDUCED BY THE INSTRUMENT, IV METHODS CAN ESTIMATE THE CAUSAL EFFECT OF THE TREATMENT.

Q: WHAT IS SENSITIVITY ANALYSIS IN THE CONTEXT OF CAUSAL INFERENCE?

A: SENSITIVITY ANALYSIS IS A TECHNIQUE USED TO ASSESS HOW SENSITIVE THE STUDY'S CONCLUSIONS ARE TO POTENTIAL VIOLATIONS OF KEY ASSUMPTIONS, MOST NOTABLY THE ASSUMPTION OF NO UNMEASURED CONFOUNDING. IT INVOLVES QUANTIFYING THE STRENGTH OF AN UNMEASURED CONFOUNDER THAT WOULD BE REQUIRED TO CHANGE THE STUDY'S FINDINGS, THEREBY PROVIDING A MEASURE OF ROBUSTNESS.

Q: WHEN IS REGRESSION DISCONTINUITY DESIGN (RDD) A SUITABLE METHOD FOR CAUSAL INFERENCE?

A: RDD IS SUITABLE WHEN THE ASSIGNMENT TO A TREATMENT OR INTERVENTION IS DETERMINED BY WHETHER AN INDIVIDUAL'S

SCORE ON A SPECIFIC CONTINUOUS VARIABLE FALLS ABOVE OR BELOW A PRE-DEFINED CUTOFF POINT. BY COMPARING INDIVIDUALS JUST ABOVE AND JUST BELOW THIS CUTOFF, RDD CAN ESTIMATE THE LOCAL CAUSAL EFFECT OF THE TREATMENT.
