

CAUSAL INFERENCE SOCIAL SCIENCE

THE ROLE OF CAUSAL INFERENCE IN SOCIAL SCIENCE RESEARCH

CAUSAL INFERENCE SOCIAL SCIENCE IS A CORNERSTONE FOR UNDERSTANDING THE COMPLEX INTERPLAY OF HUMAN BEHAVIOR, SOCIETAL STRUCTURES, AND POLICY INTERVENTIONS. IT MOVES BEYOND MERE CORRELATION TO ESTABLISH WHETHER A SPECIFIC FACTOR TRULY CAUSES AN OBSERVED OUTCOME. IN FIELDS RANGING FROM ECONOMICS AND POLITICAL SCIENCE TO SOCIOLOGY AND PSYCHOLOGY, THE ABILITY TO DISCERN CAUSE-AND-EFFECT RELATIONSHIPS IS PARAMOUNT FOR DEVELOPING EFFECTIVE POLICIES, TESTING THEORIES, AND MAKING INFORMED PREDICTIONS. THIS ARTICLE DELVES INTO THE FUNDAMENTAL PRINCIPLES, METHODOLOGIES, AND CHALLENGES INHERENT IN APPLYING CAUSAL INFERENCE TECHNIQUES WITHIN THE SOCIAL SCIENCES, EXPLORING HOW RESEARCHERS NAVIGATE OBSERVATIONAL DATA TO APPROXIMATE EXPERIMENTAL RIGOR. WE WILL EXAMINE THE CRITICAL ASSUMPTIONS REQUIRED FOR VALID INFERENCE, THE VARIOUS QUANTITATIVE AND QUALITATIVE APPROACHES EMPLOYED, AND THE ONGOING EVOLUTION OF THESE METHODS IN AN INCREASINGLY DATA-RICH ENVIRONMENT.

THE FUTURE OF CAUSAL INFERENCE IN SOCIAL SCIENCE RESEARCH

UNDERSTANDING THE CORE PROBLEM: CORRELATION VS. CAUSATION

THE FUNDAMENTAL CHALLENGE IN SOCIAL SCIENCE RESEARCH IS DISTINGUISHING BETWEEN MERE ASSOCIATION AND GENUINE CAUSATION. MANY SOCIAL PHENOMENA ARE INFLUENCED BY A MULTITUDE OF INTERCONNECTED FACTORS, MAKING IT DIFFICULT TO ISOLATE THE IMPACT OF ANY SINGLE VARIABLE. FOR INSTANCE, OBSERVING THAT INDIVIDUALS WITH HIGHER LEVELS OF EDUCATION TEND TO EARN MORE MONEY (A CORRELATION) DOES NOT AUTOMATICALLY MEAN THAT EDUCATION CAUSES HIGHER EARNINGS. OTHER UNOBSERVED FACTORS, SUCH AS INNATE ABILITY, FAMILY BACKGROUND, OR ACCESS TO NETWORKS, COULD BE DRIVING BOTH EDUCATIONAL ATTAINMENT AND EARNING POTENTIAL.

WITHOUT A ROBUST FRAMEWORK FOR CAUSAL INFERENCE, SOCIAL SCIENTISTS RISK DRAWING INCORRECT CONCLUSIONS THAT CAN LEAD TO FLAWED POLICY RECOMMENDATIONS OR MISINTERPRETATIONS OF SOCIAL TRENDS. THE GOAL IS TO ESTABLISH A COUNTERFACTUAL SCENARIO: WHAT WOULD HAVE HAPPENED TO AN OUTCOME IF THE PRESUMED CAUSE HAD NOT OCCURRED? THIS HYPOTHETICAL COMPARISON IS THE ESSENCE OF CAUSAL INFERENCE, AND IT IS PRECISELY THIS COUNTERFACTUAL THAT RESEARCHERS STRIVE TO ESTIMATE, OFTEN THROUGH SOPHISTICATED ANALYTICAL TECHNIQUES WHEN DIRECT EXPERIMENTATION IS IMPOSSIBLE.

KEY CONCEPTS IN CAUSAL INFERENCE FOR SOCIAL SCIENCE

SEVERAL FOUNDATIONAL CONCEPTS UNDERPIN THE PRACTICE OF CAUSAL INFERENCE IN SOCIAL SCIENCE. THESE IDEAS PROVIDE THE THEORETICAL SCAFFOLDING UPON WHICH METHODOLOGIES ARE BUILT AND INTERPRETATIONS ARE MADE. GRASPING THESE PRINCIPLES IS ESSENTIAL FOR UNDERSTANDING THE STRENGTHS AND LIMITATIONS OF VARIOUS RESEARCH DESIGNS.

THE COUNTERFACTUAL FRAMEWORK

THE COUNTERFACTUAL MODEL, OFTEN ATTRIBUTED TO DONALD RUBIN, IS CENTRAL TO CAUSAL INFERENCE. IT POSITS THAT FOR ANY GIVEN INDIVIDUAL, WE CAN ONLY OBSERVE ONE OF TWO POTENTIAL OUTCOMES: THE OUTCOME THAT OCCURS WHEN THEY ARE EXPOSED TO A TREATMENT OR INTERVENTION, AND THE OUTCOME THAT WOULD HAVE OCCURRED IF THEY WERE NOT

EXPOSED. THE CAUSAL EFFECT FOR THAT INDIVIDUAL IS THE DIFFERENCE BETWEEN THESE TWO POTENTIAL OUTCOMES. SINCE WE CAN NEVER OBSERVE BOTH SIMULTANEOUSLY FOR THE SAME INDIVIDUAL, CAUSAL INFERENCE BECOMES A PROBLEM OF ESTIMATING THIS UNOBSERVABLE COUNTERFACTUAL.

CONFOUNDING VARIABLES

CONFOUNDING VARIABLES ARE FACTORS THAT ARE ASSOCIATED WITH BOTH THE PRESUMED CAUSE (TREATMENT) AND THE OUTCOME OF INTEREST. THEY DISTORT THE OBSERVED RELATIONSHIP BETWEEN THE TREATMENT AND OUTCOME, LEADING TO BIASED ESTIMATES OF THE CAUSAL EFFECT. FOR EXAMPLE, IN A STUDY EXAMINING THE EFFECT OF A NEW TEACHING METHOD ON STUDENT PERFORMANCE, CLASS SIZE MIGHT BE A CONFOUNDER IF LARGER CLASSES ARE ALSO ASSIGNED TO TEACHERS WITH LESS EXPERIENCE, AND BOTH CLASS SIZE AND TEACHER EXPERIENCE AFFECT STUDENT PERFORMANCE.

SELECTION BIAS

SELECTION BIAS OCCURS WHEN THE GROUPS BEING COMPARED (E.G., TREATED VERSUS CONTROL) ARE SYSTEMATICALLY DIFFERENT IN WAYS THAT AFFECT THE OUTCOME, EVEN BEFORE THE TREATMENT IS APPLIED. THIS IS A COMMON ISSUE IN OBSERVATIONAL STUDIES WHERE INDIVIDUALS SELF-SELECT INTO OR OUT OF CERTAIN CONDITIONS. FOR EXAMPLE, IF A JOB TRAINING PROGRAM ONLY ATTRACTS HIGHLY MOTIVATED INDIVIDUALS, ANY OBSERVED IMPROVEMENT IN EMPLOYMENT RATES MIGHT BE DUE TO THEIR PRE-EXISTING MOTIVATION RATHER THAN THE PROGRAM ITSELF.

IGNORABILITY (CONDITIONAL INDEPENDENCE)

IGNORABILITY, ALSO KNOWN AS CONDITIONAL INDEPENDENCE OR NO UNMEASURED CONFOUNDING, IS A CRUCIAL ASSUMPTION FOR MANY CAUSAL INFERENCE METHODS. IT STATES THAT, CONDITIONAL ON A SET OF OBSERVED COVARIATES, THE TREATMENT ASSIGNMENT IS INDEPENDENT OF THE POTENTIAL OUTCOMES. IN SIMPLER TERMS, ONCE WE HAVE ACCOUNTED FOR ALL RELEVANT OBSERVED DIFFERENCES BETWEEN THE TREATED AND CONTROL GROUPS, THERE ARE NO UNMEASURED FACTORS THAT SYSTEMATICALLY INFLUENCE BOTH TREATMENT ASSIGNMENT AND THE OUTCOME.

POSITIVITY (COMMON SUPPORT)

THE POSITIVITY ASSUMPTION, OR COMMON SUPPORT, REQUIRES THAT FOR EVERY COMBINATION OF COVARIATES, THERE IS A NON-ZERO PROBABILITY OF RECEIVING EITHER THE TREATMENT OR CONTROL. THIS MEANS THAT FOR ANY OBSERVABLE CHARACTERISTICS, THERE MUST BE INDIVIDUALS IN BOTH THE TREATED AND CONTROL GROUPS. IF CERTAIN INDIVIDUALS ARE GUARANTEED TO RECEIVE OR NOT RECEIVE THE TREATMENT BASED ON THEIR CHARACTERISTICS, THEN WE CANNOT MAKE VALID COMPARISONS FOR THOSE INDIVIDUALS, AND GENERALIZATION MAY BE COMPROMISED.

METHODOLOGIES FOR CAUSAL INFERENCE IN SOCIAL SCIENCE

SOCIAL SCIENTISTS EMPLOY A DIVERSE TOOLKIT OF METHODOLOGIES TO APPROXIMATE EXPERIMENTAL CONDITIONS AND DRAW CAUSAL CONCLUSIONS FROM OBSERVATIONAL DATA. THESE METHODS RANGE FROM QUASI-EXPERIMENTAL DESIGNS THAT MIMIC RANDOMIZATION TO STATISTICAL TECHNIQUES THAT ATTEMPT TO CONTROL FOR CONFOUNDING.

RANDOMIZED CONTROLLED TRIALS (RCTs)

WHILE NOT ALWAYS FEASIBLE OR ETHICAL IN SOCIAL SCIENCE, RCTs ARE CONSIDERED THE GOLD STANDARD FOR ESTABLISHING CAUSALITY. IN AN RCT, INDIVIDUALS ARE RANDOMLY ASSIGNED TO EITHER A TREATMENT GROUP OR A CONTROL GROUP. RANDOMIZATION ENSURES THAT, ON AVERAGE, THE GROUPS ARE SIMILAR IN ALL RESPECTS EXCEPT FOR THE TREATMENT ITSELF, THUS MINIMIZING CONFOUNDING AND SELECTION BIAS. WHEN AN RCT IS CONDUCTED, THE DIFFERENCE IN OUTCOMES BETWEEN THE TWO GROUPS CAN BE ATTRIBUTED TO THE TREATMENT.

QUASI-EXPERIMENTAL DESIGNS

WHEN RANDOMIZATION IS NOT POSSIBLE, RESEARCHERS OFTEN TURN TO QUASI-EXPERIMENTAL DESIGNS. THESE DESIGNS LEVERAGE NATURALLY OCCURRING VARIATIONS OR SPECIFIC RESEARCH SETTINGS TO CREATE COMPARISONS THAT RESEMBLE EXPERIMENTAL ONES.

- **DIFFERENCE-IN-DIFFERENCES (DiD):** THIS METHOD COMPARES THE CHANGE IN AN OUTCOME OVER TIME FOR A TREATMENT GROUP WITH THE CHANGE IN THE OUTCOME OVER THE SAME PERIOD FOR A CONTROL GROUP. IT ASSUMES THAT IN THE ABSENCE OF THE TREATMENT, THE TREND IN THE OUTCOME FOR THE TREATMENT GROUP WOULD HAVE BEEN THE SAME AS THAT FOR THE CONTROL GROUP.
- **REGRESSION DISCONTINUITY DESIGN (RDD):** RDD EXPLOITS A CUTOFF RULE OR THRESHOLD THAT DETERMINES TREATMENT ASSIGNMENT. INDIVIDUALS JUST ABOVE AND JUST BELOW THE CUTOFF ARE ASSUMED TO BE SIMILAR, ALLOWING FOR A COMPARISON OF OUTCOMES. FOR EXAMPLE, IF ELIGIBILITY FOR A SCHOLARSHIP IS BASED ON A TEST SCORE CUTOFF, COMPARING STUDENTS JUST ABOVE AND BELOW THE CUTOFF CAN REVEAL THE SCHOLARSHIP'S CAUSAL EFFECT.
- **INSTRUMENTAL VARIABLES (IV):** IV METHODS ARE USED WHEN UNOBSERVED CONFOUNDING IS PRESENT. AN INSTRUMENTAL VARIABLE IS A VARIABLE THAT AFFECTS THE TREATMENT ASSIGNMENT BUT DOES NOT DIRECTLY AFFECT THE OUTCOME, EXCEPT THROUGH ITS INFLUENCE ON THE TREATMENT. THIS ALLOWS RESEARCHERS TO ISOLATE THE VARIATION IN THE TREATMENT THAT IS EXOGENOUS AND THUS LESS LIKELY TO BE CONFOUNDED.
- **MATCHING METHODS:** MATCHING TECHNIQUES AIM TO CREATE COMPARABLE TREATMENT AND CONTROL GROUPS BY IDENTIFYING INDIVIDUALS WITH SIMILAR CHARACTERISTICS. COMMON METHODS INCLUDE:
 - **PROPENSITY SCORE MATCHING (PSM):** INDIVIDUALS ARE MATCHED BASED ON THEIR PROPENSITY TO RECEIVE THE TREATMENT, CALCULATED FROM A LOGISTIC REGRESSION MODEL PREDICTING TREATMENT ASSIGNMENT BASED ON OBSERVED COVARIATES.
 - **COARSENEDED EXACT MATCHING (CEM):** AIMS TO ACHIEVE EXACT BALANCE ON A SUBSET OF COVARIATES BY COARSENING THE COVARIATE DISTRIBUTIONS.
 - **COARSENEDED EXACT MATCHING (CEM):** AIMS TO ACHIEVE EXACT BALANCE ON A SUBSET OF COVARIATES BY COARSENING THE COVARIATE DISTRIBUTIONS.
- **SYNTHETIC CONTROL METHOD:** THIS APPROACH IS PARTICULARLY USEFUL FOR EVALUATING THE IMPACT OF INTERVENTIONS IN A SINGLE UNIT (E.G., A COUNTRY OR REGION). IT CONSTRUCTS A "SYNTHETIC" CONTROL GROUP BY TAKING A WEIGHTED AVERAGE OF OTHER UNITS THAT DID NOT RECEIVE THE INTERVENTION, CREATING A COUNTERFACTUAL BASED ON THE PRE-INTERVENTION TRENDS OF THE TREATED UNIT.

OBSERVATIONAL DATA ANALYSIS TECHNIQUES

BEYOND QUASI-EXPERIMENTAL DESIGNS, STATISTICAL MODELS ARE EMPLOYED TO ADJUST FOR OBSERVED CONFOUNDING IN OBSERVATIONAL DATA.

- **REGRESSION ANALYSIS:** STANDARD REGRESSION MODELS, WHEN CORRECTLY SPECIFIED AND INCLUDING RELEVANT COVARIATES, CAN PROVIDE ESTIMATES OF THE EFFECT OF A VARIABLE WHILE CONTROLLING FOR OTHERS. HOWEVER, THIS RELIES HEAVILY ON THE ASSUMPTION OF NO UNMEASURED CONFOUNDING.
- **INVERSE PROBABILITY WEIGHTING (IPW):** IPW USES THE ESTIMATED PROBABILITIES OF RECEIVING THE TREATMENT (PROPENSITY SCORES) TO WEIGHT OBSERVATIONS, CREATING A PSEUDO-POPULATION WHERE TREATMENT ASSIGNMENT IS INDEPENDENT OF OBSERVED COVARIATES. THIS MIMICS A RANDOMIZED EXPERIMENT.
- **G-COMPUTATION AND MARGINAL STRUCTURAL MODELS:** THESE ADVANCED TECHNIQUES ALLOW FOR THE ESTIMATION OF CAUSAL EFFECTS IN SETTINGS WITH TIME-VARYING TREATMENTS AND CONFOUNDERS, WHICH ARE COMMON IN LONGITUDINAL SOCIAL SCIENCE DATA.

CHALLENGES AND LIMITATIONS IN SOCIAL SCIENCE CAUSAL INFERENCE

DESPITE THE ADVANCEMENTS IN METHODOLOGIES, CAUSAL INFERENCE IN SOCIAL SCIENCE IS FRAUGHT WITH INHERENT DIFFICULTIES. RESEARCHERS MUST REMAIN ACUTELY AWARE OF THESE LIMITATIONS WHEN INTERPRETING THEIR FINDINGS.

UNMEASURED CONFOUNDING

PERHAPS THE MOST SIGNIFICANT CHALLENGE IS THE PERSISTENT THREAT OF UNMEASURED CONFOUNDING. SOCIAL PHENOMENA ARE COMPLEX, AND IT IS OFTEN IMPOSSIBLE TO IDENTIFY AND MEASURE ALL RELEVANT FACTORS THAT COULD INFLUENCE BOTH TREATMENT ASSIGNMENT AND OUTCOMES. THE IGNITABILITY ASSUMPTION IS RARELY PERFECTLY MET IN PRACTICE, MAKING ALL CAUSAL CLAIMS BASED ON OBSERVATIONAL DATA CONDITIONAL ON THE ABSENCE OF UNMEASURED CONFOUNDERS.

DATA AVAILABILITY AND QUALITY

THE SUCCESS OF MANY CAUSAL INFERENCE METHODS HINGES ON THE AVAILABILITY OF RICH, HIGH-QUALITY DATA. IN SOCIAL SCIENCE, COLLECTING SUCH DATA CAN BE EXPENSIVE, TIME-CONSUMING, AND SOMETIMES ETHICALLY PROBLEMATIC. MISSING DATA, MEASUREMENT ERROR, AND INCONSISTENT DATA COLLECTION PRACTICES CAN ALL UNDERMINE THE VALIDITY OF CAUSAL ESTIMATES.

GENERALIZABILITY (EXTERNAL VALIDITY)

EVEN WHEN A CAUSAL EFFECT IS ESTABLISHED WITHIN A SPECIFIC STUDY CONTEXT, GENERALIZING THOSE FINDINGS TO OTHER POPULATIONS, SETTINGS, OR TIME PERIODS CAN BE DIFFICULT. SOCIAL PROCESSES ARE OFTEN CONTEXT-DEPENDENT, AND WHAT HOLDS TRUE IN ONE SITUATION MAY NOT APPLY ELSEWHERE. THIS IS A PARTICULAR CONCERN WHEN WORKING WITH DATA FROM SPECIFIC GEOGRAPHIC LOCATIONS OR DEMOGRAPHIC GROUPS.

ETHICAL CONSIDERATIONS

MANY SOCIAL INTERVENTIONS, SUCH AS EDUCATIONAL PROGRAMS, PUBLIC HEALTH INITIATIVES, OR ECONOMIC POLICIES, HAVE ETHICAL IMPLICATIONS. CONDUCTING TRUE RANDOMIZED EXPERIMENTS CAN SOMETIMES BE UNETHICAL IF IT MEANS WITHHOLDING POTENTIALLY BENEFICIAL TREATMENTS FROM CERTAIN GROUPS OR EXPOSING OTHERS TO RISKS. THIS OFTEN NECESSITATES THE USE OF OBSERVATIONAL OR QUASI-EXPERIMENTAL DESIGNS, WHICH CARRY THEIR OWN INFERENTIAL CHALLENGES.

COMPLEXITY OF SOCIAL INTERVENTIONS

SOCIAL INTERVENTIONS ARE RARELY SIMPLE “ON-OFF” SWITCHES. THEY CAN HAVE MULTIPLE COMPONENTS, INTERACT WITH EXISTING SOCIAL STRUCTURES IN UNEXPECTED WAYS, AND BE IMPLEMENTED WITH VARYING DEGREES OF FIDELITY.

UNDERSTANDING THE CAUSAL PATHWAYS AND POTENTIAL SPILLOVER EFFECTS OF SUCH COMPLEX INTERVENTIONS REQUIRES SOPHISTICATED ANALYTICAL APPROACHES AND CAREFUL QUALITATIVE INVESTIGATION.

THE FUTURE OF CAUSAL INFERENCE IN SOCIAL SCIENCE RESEARCH

THE FIELD OF CAUSAL INFERENCE IS CONTINUOUSLY EVOLVING, DRIVEN BY NEW THEORETICAL DEVELOPMENTS, ADVANCEMENTS IN COMPUTATIONAL POWER, AND THE EXPLOSION OF AVAILABLE DATA. THE INTEGRATION OF MACHINE LEARNING TECHNIQUES WITH TRADITIONAL CAUSAL INFERENCE METHODS HOLDS SIGNIFICANT PROMISE FOR IMPROVING THE IDENTIFICATION AND ESTIMATION OF CAUSAL EFFECTS.

THE INCREASING AVAILABILITY OF LARGE-SCALE ADMINISTRATIVE DATA, SENSOR DATA, AND ONLINE BEHAVIORAL DATA OFFERS UNPRECEDENTED OPPORTUNITIES FOR SOCIAL SCIENTISTS TO STUDY CAUSAL RELATIONSHIPS. HOWEVER, IT ALSO NECESSITATES THE DEVELOPMENT OF NEW STATISTICAL AND COMPUTATIONAL TOOLS TO HANDLE THE VOLUME, VELOCITY, AND VARIETY OF THESE DATASETS. FURTHERMORE, A GROWING EMPHASIS ON TRANSPARENCY AND REPRODUCIBILITY IN RESEARCH IS PUSHING FOR MORE RIGOROUS APPLICATION AND REPORTING OF CAUSAL INFERENCE METHODS.

ULTIMATELY, THE PURSUIT OF CAUSAL INFERENCE IN SOCIAL SCIENCE IS AN ONGOING ENDEAVOR TO UNDERSTAND WHY THINGS HAPPEN. BY REFINING OUR METHODOLOGIES, CRITICALLY EVALUATING OUR ASSUMPTIONS, AND EMBRACING THE COMPLEXITIES OF SOCIAL LIFE, RESEARCHERS CAN CONTINUE TO ADVANCE KNOWLEDGE AND INFORM POLICIES THAT AIM TO IMPROVE HUMAN WELL-BEING AND SOCIETAL OUTCOMES.

FAQ

Q: WHAT IS THE PRIMARY GOAL OF CAUSAL INFERENCE IN SOCIAL SCIENCE?

A: THE PRIMARY GOAL OF CAUSAL INFERENCE IN SOCIAL SCIENCE IS TO MOVE BEYOND SIMPLY OBSERVING CORRELATIONS BETWEEN VARIABLES TO DETERMINE WHETHER ONE VARIABLE OR FACTOR DIRECTLY CAUSES A CHANGE IN ANOTHER, THEREBY UNDERSTANDING THE MECHANISMS AND IMPACTS OF SOCIAL PHENOMENA.

Q: WHY IS DISTINGUISHING CORRELATION FROM CAUSATION SO IMPORTANT IN SOCIAL SCIENCE RESEARCH?

A: DISTINGUISHING CORRELATION FROM CAUSATION IS CRUCIAL BECAUSE MISTAKING CORRELATION FOR CAUSATION CAN LEAD TO FLAWED CONCLUSIONS, INEFFECTIVE POLICIES, AND A MISUNDERSTANDING OF SOCIAL DYNAMICS. FOR EXAMPLE, IMPLEMENTING A POLICY BASED ON A MISTAKEN CAUSAL ASSUMPTION COULD WASTE RESOURCES OR EVEN HAVE NEGATIVE CONSEQUENCES.

Q: WHAT IS THE MOST SIGNIFICANT CHALLENGE IN APPLYING CAUSAL INFERENCE TO SOCIAL SCIENCE DATA?

A: THE MOST SIGNIFICANT CHALLENGE IS UNMEASURED CONFOUNDING, WHERE UNOBSERVED FACTORS INFLUENCE BOTH THE PRESUMED CAUSE AND THE OUTCOME, LEADING TO BIASED ESTIMATES OF THE CAUSAL EFFECT. IT IS OFTEN IMPOSSIBLE TO MEASURE AND ACCOUNT FOR ALL POTENTIAL CONFOUNDING VARIABLES IN COMPLEX SOCIAL SYSTEMS.

Q: HOW DO RANDOMIZED CONTROLLED TRIALS (RCTs) HELP WITH CAUSAL INFERENCE IN SOCIAL SCIENCE?

A: RCTs ARE CONSIDERED THE GOLD STANDARD BECAUSE RANDOM ASSIGNMENT ENSURES THAT, ON AVERAGE, TREATMENT AND CONTROL GROUPS ARE SIMILAR IN ALL ASPECTS EXCEPT FOR THE INTERVENTION BEING STUDIED. THIS SYSTEMATIC BALANCE MINIMIZES THE INFLUENCE OF CONFOUNDING VARIABLES, ALLOWING RESEARCHERS TO ATTRIBUTE OBSERVED DIFFERENCES IN OUTCOMES DIRECTLY TO THE INTERVENTION.

Q: WHAT ARE SOME COMMON QUASI-EXPERIMENTAL DESIGNS USED WHEN RCTs ARE NOT FEASIBLE?

A: COMMON QUASI-EXPERIMENTAL DESIGNS INCLUDE DIFFERENCE-IN-DIFFERENCES (DiD), REGRESSION DISCONTINUITY DESIGN (RDD), INSTRUMENTAL VARIABLES (IV), AND THE SYNTHETIC CONTROL METHOD. THESE METHODS LEVERAGE NATURALLY OCCURRING VARIATIONS OR SPECIFIC RESEARCH SETTINGS TO APPROXIMATE EXPERIMENTAL CONDITIONS.

Q: WHAT ROLE DOES PROPENSITY SCORE MATCHING PLAY IN CAUSAL INFERENCE?

A: PROPENSITY SCORE MATCHING IS A STATISTICAL TECHNIQUE USED IN OBSERVATIONAL STUDIES TO REDUCE SELECTION BIAS AND CONFOUNDING. IT INVOLVES MATCHING INDIVIDUALS IN THE TREATMENT GROUP WITH SIMILAR INDIVIDUALS IN THE CONTROL GROUP BASED ON THEIR PROBABILITY (PROPENSITY) OF RECEIVING THE TREATMENT, THUS CREATING MORE COMPARABLE GROUPS FOR ANALYSIS.

Q: HOW DOES THE AVAILABILITY OF "BIG DATA" IMPACT CAUSAL INFERENCE IN SOCIAL SCIENCE?

A: THE AVAILABILITY OF BIG DATA PRESENTS BOTH OPPORTUNITIES AND CHALLENGES. IT ALLOWS FOR THE STUDY OF MORE COMPLEX RELATIONSHIPS AND THE USE OF ADVANCED ANALYTICAL TECHNIQUES, BUT IT ALSO REQUIRES SOPHISTICATED METHODS TO HANDLE LARGE DATASETS, POTENTIAL BIASES WITHIN THE DATA, AND THE ONGOING RISK OF UNMEASURED CONFOUNDING.

Q: WHAT IS THE CONCEPT OF A "COUNTERFACTUAL" IN CAUSAL INFERENCE?

A: THE COUNTERFACTUAL REFERS TO THE HYPOTHETICAL OUTCOME THAT WOULD HAVE OCCURRED FOR AN INDIVIDUAL OR UNIT IF THEY HAD NOT BEEN EXPOSED TO THE TREATMENT OR INTERVENTION BEING STUDIED. CAUSAL INFERENCE AIMS TO ESTIMATE THIS UNOBSERVABLE COUNTERFACTUAL TO DETERMINE THE TRUE EFFECT OF THE CAUSE.
