COMMON CHALLENGES AND HOW TO OVERCOME THEM

UNDERSTANDING SEQUENCES: THE BUILDING BLOCKS

AT ITS CORE, A SEQUENCE IS SIMPLY AN ORDERED LIST OF NUMBERS. THINK OF IT LIKE A LINE OF DOMINOES, WHERE EACH DOMINO IS A TERM AND THEIR PLACEMENT DICTATES THE ORDER. THESE NUMBERS, OR TERMS, OFTEN FOLLOW A SPECIFIC RULE OR PATTERN. RECOGNIZING AND UNDERSTANDING THIS PATTERN IS THE ABSOLUTE FIRST STEP IN TACKLING ANY COLLEGE ALGEBRA PROBLEM SOLVING SEQUENCES SERIES CHALLENGE. WHETHER IT'S NUMBERS INCREASING BY A FIXED AMOUNT, DECREASING BY A CONSTANT FACTOR, OR FOLLOWING A MORE COMPLEX RECURSIVE RULE, IDENTIFYING THAT UNDERLYING STRUCTURE IS KEY.

IN MATHEMATICAL TERMS, A SEQUENCE IS TYPICALLY DENOTED BY A SET OF TERMS, LIKE $a_1, a_2, a_3, \dots, a_n, \dots$. HERE, a_1 IS THE FIRST TERM, a_2 IS THE SECOND, AND a_n REPRESENTS THE n TH TERM. THE SUBSCRIPT ' n ' INDICATES THE POSITION OF THE TERM WITHIN THE SEQUENCE. SOMETIMES, SEQUENCES ARE DEFINED BY AN EXPLICIT FORMULA, MEANING YOU CAN DIRECTLY CALCULATE ANY TERM BY PLUGGING ITS POSITION ' n ' INTO THE FORMULA. OTHER TIMES, THEY ARE DEFINED RECURSIVELY, WHERE EACH TERM IS FOUND BY USING THE PREVIOUS TERM(S). BOTH APPROACHES HAVE THEIR STRENGTHS AND ARE CRUCIAL FOR DIFFERENT TYPES OF PROBLEMS.

IDENTIFYING PATTERNS IN SEQUENCES

THE ART OF SEQUENCE PROBLEM-SOLVING OFTEN BOILS DOWN TO ASTUTE PATTERN RECOGNITION. FOR INSTANCE, IF YOU SEE THE NUMBERS 3, 6, 9, 12, THE PATTERN IS QUITE CLEAR: EACH NUMBER IS 3 MORE THAN THE PREVIOUS ONE. THIS SIMPLE OBSERVATION IS THE FOUNDATION FOR MORE COMPLEX ANALYSES. YOU MIGHT BE ASKED TO FIND THE NEXT TERM IN A SEQUENCE, OR PERHAPS TO DETERMINE THE FORMULA FOR THE n TH TERM. PRACTICE IS YOUR BEST FRIEND HERE; THE MORE SEQUENCES YOU EXAMINE, THE QUICKER YOU'LL BECOME AT SPOTTING THE SUBTLE (AND NOT-SO-SUBTLE) RELATIONSHIPS BETWEEN TERMS.

CONSIDER A SEQUENCE LIKE 2, 4, 8, 16. HERE, THE RELATIONSHIP ISN'T ADDITION, BUT MULTIPLICATION. EACH TERM IS DOUBLE THE ONE BEFORE IT. RECOGNIZING WHETHER A SEQUENCE INVOLVES ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, OR A COMBINATION OF OPERATIONS IS PARAMOUNT. SOMETIMES, THE PATTERN MIGHT NOT BE IMMEDIATELY OBVIOUS. YOU MIGHT NEED TO LOOK AT THE DIFFERENCES BETWEEN CONSECUTIVE TERMS, OR THE RATIOS OF CONSECUTIVE TERMS, TO UNCOVER THE UNDERLYING RULE. DON'T BE AFRAID TO JOT DOWN THESE DIFFERENCES AND RATIOS; THEY OFTEN PROVIDE THE CRUCIAL CLUE.

ARITHMETIC SEQUENCES: CONSTANT DIFFERENCES

ARITHMETIC SEQUENCES ARE AMONG THE MOST STRAIGHTFORWARD TYPES YOU'LL ENCOUNTER IN COLLEGE ALGEBRA PROBLEM SOLVING SEQUENCES SERIES. THE DEFINING CHARACTERISTIC OF AN ARITHMETIC SEQUENCE IS THAT THE DIFFERENCE BETWEEN ANY TWO CONSECUTIVE TERMS IS CONSTANT. THIS CONSTANT DIFFERENCE IS CALLED THE COMMON DIFFERENCE, OFTEN DENOTED BY 'D'. IF YOU HAVE A SEQUENCE WHERE YOU CONSISTENTLY ADD OR SUBTRACT THE SAME NUMBER TO GET FROM ONE TERM TO THE NEXT, YOU'RE DEALING WITH AN ARITHMETIC SEQUENCE.

FOR EXAMPLE, THE SEQUENCE 5, 8, 11, 14, 17 IS AN ARITHMETIC SEQUENCE BECAUSE THE COMMON DIFFERENCE 'D' IS 3 ($8 - 5 = 3$, $11 - 8 = 3$, AND SO ON). SIMILARLY, 20, 15, 10, 5 IS AN ARITHMETIC SEQUENCE WITH A COMMON DIFFERENCE OF -5. UNDERSTANDING THIS COMMON DIFFERENCE ALLOWS US TO PREDICT ANY TERM IN THE SEQUENCE WITHOUT HAVING TO LIST THEM ALL OUT, MAKING PROBLEM-SOLVING MUCH MORE EFFICIENT.

THE FORMULA FOR THE NTH TERM OF AN ARITHMETIC SEQUENCE

TO FIND ANY TERM IN AN ARITHMETIC SEQUENCE WITHOUT LISTING ALL THE PRECEDING TERMS, WE USE A POWERFUL FORMULA: $A_n = A_1 + (n-1)D$. HERE, A_n IS THE TERM YOU WANT TO FIND, A_1 IS THE FIRST TERM OF THE SEQUENCE, 'N' IS THE POSITION OF THE TERM YOU'RE LOOKING FOR, AND 'D' IS THE COMMON DIFFERENCE. THIS FORMULA IS A CORNERSTONE FOR SOLVING MANY PROBLEMS RELATED TO ARITHMETIC SEQUENCES. IT ALLOWS YOU TO JUMP DIRECTLY TO THE 100TH TERM, OR THE 500TH TERM, WITH JUST A FEW CALCULATIONS.

LET'S SAY YOU HAVE AN ARITHMETIC SEQUENCE STARTING WITH 7, AND THE COMMON DIFFERENCE IS 4. TO FIND THE 25TH TERM, YOU WOULD USE THE FORMULA: $A_{25} = 7 + (25-1) \times 4$. THIS SIMPLIFIES TO $A_{25} = 7 + 24 \times 4$, WHICH EQUALS $7 + 96 = 103$. SO, THE 25TH TERM OF THIS SEQUENCE IS 103. MASTERING THIS FORMULA IS ESSENTIAL FOR EFFICIENTLY HANDLING ARITHMETIC SEQUENCE PROBLEMS.

GEOMETRIC SEQUENCES: CONSTANT RATIOS

MOVING ON FROM CONSTANT DIFFERENCES, WE ENCOUNTER GEOMETRIC SEQUENCES, WHICH ARE CHARACTERIZED BY A CONSTANT RATIO BETWEEN CONSECUTIVE TERMS. THIS CONSTANT MULTIPLIER IS KNOWN AS THE COMMON RATIO, DENOTED BY 'R'. IN A GEOMETRIC SEQUENCE, YOU MULTIPLY EACH TERM BY THE SAME NUMBER TO GET THE NEXT TERM. THESE SEQUENCES CAN GROW VERY RAPIDLY OR SHRINK TOWARDS ZERO, DEPENDING ON THE VALUE OF THE COMMON RATIO.

AN EXAMPLE OF A GEOMETRIC SEQUENCE IS 2, 6, 18, 54. HERE, THE COMMON RATIO 'R' IS 3 ($6 / 2 = 3$, $18 / 6 = 3$, ETC.). ANOTHER EXAMPLE IS 81, 27, 9, 3, WHICH HAS A COMMON RATIO OF $1/3$ ($27 / 81 = 1/3$). RECOGNIZING WHETHER YOU'RE DEALING WITH AN ARITHMETIC OR GEOMETRIC SEQUENCE IS A CRITICAL FIRST STEP IN APPLYING THE CORRECT PROBLEM-SOLVING TECHNIQUES.

THE FORMULA FOR THE NTH TERM OF A GEOMETRIC SEQUENCE

SIMILAR TO ARITHMETIC SEQUENCES, THERE'S A HANDY FORMULA TO FIND ANY TERM IN A GEOMETRIC SEQUENCE WITHOUT LISTING OUT ALL THE PREVIOUS ONES: $A_n = A_1 \times r^{(n-1)}$. IN THIS FORMULA, A_n IS THE DESIRED TERM, A_1 IS THE FIRST TERM, 'N' IS THE TERM'S POSITION, AND 'R' IS THE COMMON RATIO. THIS FORMULA IS INCREDIBLY USEFUL FOR UNDERSTANDING THE LONG-TERM BEHAVIOR OF GEOMETRIC SEQUENCES.

SUPPOSE YOU HAVE A GEOMETRIC SEQUENCE THAT STARTS WITH 3 AND HAS A COMMON RATIO OF 2. TO FIND THE 10TH TERM, YOU'D USE THE FORMULA: $A_{10} = 3 \times 2^{(10-1)}$. THIS BECOMES $A_{10} = 3 \times 2^9$. SINCE 2^9 IS 512, THE 10TH TERM IS $3 \times 512 = 1536$. THE POWER OF THIS FORMULA LIES IN ITS ABILITY TO QUICKLY

CALCULATE TERMS FAR DOWN THE LINE.

INTRODUCTION TO SERIES: SUMMING IT UP

WHILE A SEQUENCE IS A LIST OF NUMBERS, A SERIES IS THE SUM OF THE TERMS IN A SEQUENCE. SO, IF YOU HAVE A SEQUENCE LIKE 1, 2, 3, 4, THE CORRESPONDING SERIES WOULD BE $1 + 2 + 3 + 4$. THE NOTATION FOR A SERIES OFTEN INVOLVES THE GREEK LETTER SIGMA (Σ), INDICATING SUMMATION. UNDERSTANDING HOW TO CALCULATE THE SUM OF SERIES IS A CRUCIAL ASPECT OF COLLEGE ALGEBRA PROBLEM SOLVING SEQUENCES SERIES, AS IT ALLOWS US TO QUANTIFY THE TOTAL ACCUMULATION OF A PATTERN.

SERIES CAN BE FINITE, MEANING THEY HAVE A SET NUMBER OF TERMS TO ADD UP, OR INFINITE, MEANING THEY THEORETICALLY CONTINUE FOREVER. THE NATURE OF THE SERIES – WHETHER IT'S ARITHMETIC, GEOMETRIC, OR SOMETHING ELSE – DICTATES THE METHODS USED TO FIND ITS SUM. THE ABILITY TO EFFICIENTLY SUM THESE SEQUENCES UNLOCKS SOLUTIONS TO PROBLEMS IN AREAS LIKE FINANCE, PHYSICS, AND COMPUTER SCIENCE.

ARITHMETIC SERIES: THE SUM OF AN ARITHMETIC SEQUENCE

WHEN YOU NEED TO FIND THE SUM OF THE TERMS IN AN ARITHMETIC SEQUENCE, YOU'RE DEALING WITH AN ARITHMETIC SERIES. THERE ARE A COUPLE OF VERY EFFECTIVE FORMULAS FOR CALCULATING THIS SUM. THE FIRST IS PARTICULARLY USEFUL WHEN YOU KNOW THE FIRST TERM (a_1), THE LAST TERM (a_n), AND THE NUMBER OF TERMS (n): $S_n = \frac{n}{2}(a_1 + a_n)$. THIS FORMULA INTUITIVELY MAKES SENSE: YOU'RE ESSENTIALLY AVERAGING THE FIRST AND LAST TERM AND MULTIPLYING BY THE NUMBER OF TERMS.

ALTERNATIVELY, IF YOU DON'T KNOW THE LAST TERM BUT DO KNOW THE FIRST TERM (a_1), THE COMMON DIFFERENCE (d), AND THE NUMBER OF TERMS (n), YOU CAN USE THE FORMULA: $S_n = \frac{n}{2}(2a_1 + (n-1)d)$. THIS FORMULA IS DERIVED BY SUBSTITUTING THE FORMULA FOR a_n INTO THE FIRST SUM FORMULA. BOTH ARE INDISPENSABLE TOOLS FOR SOLVING PROBLEMS INVOLVING ARITHMETIC SERIES.

EXAMPLE OF AN ARITHMETIC SERIES PROBLEM

LET'S SAY YOU NEED TO FIND THE SUM OF THE FIRST 50 POSITIVE ODD INTEGERS. THE SEQUENCE IS 1, 3, 5, ..., WHICH IS AN ARITHMETIC SEQUENCE WITH $a_1 = 1$ AND $d = 2$. TO FIND THE SUM OF THE FIRST 50 TERMS ($n=50$), WE CAN USE THE SECOND FORMULA: $S_{50} = \frac{50}{2}(2 \times 1 + (50-1) \times 2)$. THIS SIMPLIFIES TO $S_{50} = 25(2 + 49 \times 2) = 25(2 + 98) = 25(100) = 2500$. THUS, THE SUM OF THE FIRST 50 POSITIVE ODD INTEGERS IS 2500.

GEOMETRIC SERIES: THE SUM OF A GEOMETRIC SEQUENCE

WHEN YOU'RE ADDING UP THE TERMS OF A GEOMETRIC SEQUENCE, YOU'RE DEALING WITH A GEOMETRIC SERIES. THE FORMULA FOR THE SUM OF A FINITE GEOMETRIC SERIES DEPENDS ON WHETHER THE COMMON RATIO ' r ' IS EQUAL TO 1 OR NOT. IF $r=1$, THEN EVERY TERM IS THE SAME, AND THE SUM IS SIMPLY $n \times a_1$. HOWEVER, IF $r \neq 1$, THE FORMULA IS $S_n = \frac{a_1(1 - r^n)}{1 - r}$. THIS FORMULA IS INCREDIBLY POWERFUL FOR QUICKLY CALCULATING THE SUM OF MANY TERMS IN A GEOMETRIC PROGRESSION.

THIS FORMULA ARISES FROM A CLEVER ALGEBRAIC MANIPULATION. BY WRITING OUT THE SERIES AND THEN MULTIPLYING IT BY ' r ' AND SUBTRACTING THE TWO, MOST OF THE TERMS CANCEL OUT, LEAVING A SIMPLE EXPRESSION FOR THE SUM. UNDERSTANDING THE DERIVATION CAN HELP SOLIDIFY YOUR GRASP OF THE CONCEPT.

INFINITE SERIES: APPROACHING INFINITY

THE CONCEPT OF INFINITE SERIES IN COLLEGE ALGEBRA PROBLEM SOLVING SEQUENCES SERIES OPENS UP A FASCINATING REALM OF MATHEMATICS. AN INFINITE SERIES IS THE SUM OF AN INFINITE NUMBER OF TERMS IN A SEQUENCE. THE CRUCIAL QUESTION FOR INFINITE SERIES IS WHETHER THEY CONVERGE (THEIR SUM APPROACHES A FINITE VALUE) OR DIVERGE (THEIR SUM GROWS INFINITELY LARGE OR DOES NOT SETTLE ON A SINGLE VALUE). FOR GEOMETRIC SERIES, CONVERGENCE HINGES ON THE COMMON RATIO ' r '.

SPECIFICALLY, AN INFINITE GEOMETRIC SERIES CONVERGES IF THE ABSOLUTE VALUE OF THE COMMON RATIO IS LESS THAN 1 (I.E., $|r| < 1$). IF THIS CONDITION IS MET, THE SUM OF THE INFINITE SERIES IS GIVEN BY THE FORMULA: $S_{\infty} = \frac{a_1}{1 - r}$. THIS FORMULA IS A REMARKABLE RESULT, SHOWING THAT AN ENDLESS SUM CAN INDEED RESULT IN A FINITE NUMBER. IF $|r| \geq 1$, THE INFINITE GEOMETRIC SERIES DIVERGES AND DOES NOT HAVE A FINITE SUM.

THE IMPORTANCE OF CONVERGENCE

THE CONCEPT OF CONVERGENCE IS VITAL. IMAGINE REPEATEDLY HALVING A DISTANCE; YOU'LL GET CLOSER AND CLOSER TO YOUR DESTINATION BUT NEVER QUITE REACH IT IN AN INFINITE NUMBER OF STEPS. HOWEVER, THE TOTAL DISTANCE COVERED APPROACHES A FINITE VALUE. THIS IS THE ESSENCE OF A CONVERGENT INFINITE SERIES. IN CONTRAST, AN INFINITE SERIES LIKE $1 + 2 + 3 + 4 + \dots$ CLEARLY GROWS WITHOUT BOUND, SO IT DIVERGES.

UNDERSTANDING WHEN AN INFINITE SERIES CONVERGES IS CRITICAL FOR APPLICATIONS IN CALCULUS, DIFFERENTIAL EQUATIONS, AND MANY AREAS OF SCIENCE AND ENGINEERING WHERE INFINITE PROCESSES ARE MODELED. FOR COLLEGE ALGEBRA PROBLEM SOLVING SEQUENCES SERIES, RECOGNIZING THE CONDITION FOR CONVERGENCE IN GEOMETRIC SERIES IS A KEY SKILL.

STRATEGIES FOR COLLEGE ALGEBRA PROBLEM SOLVING SEQUENCES SERIES

TACKLING PROBLEMS INVOLVING SEQUENCES AND SERIES IN COLLEGE ALGEBRA EFFECTIVELY REQUIRES A STRATEGIC APPROACH. FIRST AND FOREMOST, ALWAYS READ THE PROBLEM CAREFULLY AND IDENTIFY WHAT IS BEING ASKED. ARE YOU LOOKING FOR A SPECIFIC TERM, THE SUM OF A FINITE NUMBER OF TERMS, OR THE SUM OF AN INFINITE SERIES? NEXT, DETERMINE THE TYPE OF SEQUENCE OR SERIES YOU ARE DEALING WITH – IS IT ARITHMETIC, GEOMETRIC, OR NEITHER?

ONCE YOU'VE IDENTIFIED THE TYPE, RECALL OR DERIVE THE RELEVANT FORMULAS. DON'T BE AFRAID TO WRITE DOWN THE FIRST FEW TERMS OF THE SEQUENCE TO HELP VISUALIZE THE PATTERN. FOR PROBLEMS INVOLVING SUMS, CONSIDER WHETHER YOU HAVE ENOUGH INFORMATION TO USE THE SUM FORMULAS DIRECTLY OR IF YOU NEED TO FIRST FIND MISSING VALUES LIKE THE COMMON DIFFERENCE, COMMON RATIO, OR THE NUMBER OF TERMS. BREAKING DOWN COMPLEX PROBLEMS INTO SMALLER, MANAGEABLE STEPS IS KEY.

COMMON CHALLENGES AND HOW TO OVERCOME THEM

ONE COMMON HURDLE IN COLLEGE ALGEBRA PROBLEM SOLVING SEQUENCES SERIES IS MIXING UP ARITHMETIC AND GEOMETRIC FORMULAS. ALWAYS DOUBLE-CHECK IF YOU ARE ADDING A CONSTANT DIFFERENCE OR MULTIPLYING BY A CONSTANT RATIO. ANOTHER CHALLENGE IS DEALING WITH NEGATIVE COMMON RATIOS OR COMMON DIFFERENCES; ENSURE YOU HANDLE THE SIGNS CORRECTLY IN YOUR CALCULATIONS. FOR INFINITE SERIES, A FREQUENT MISTAKE IS APPLYING THE SUM FORMULA WHEN THE SERIES ACTUALLY DIVERGES.

WHEN PROBLEMS INVOLVE REAL-WORLD SCENARIOS, TRANSLATING THE SITUATION INTO A SEQUENCE OR SERIES CAN BE TRICKY. LOOK FOR KEYWORDS THAT SUGGEST A CONSTANT RATE OF CHANGE (ARITHMETIC) OR A CONSTANT PERCENTAGE CHANGE (GEOMETRIC). FOR INSTANCE, A SALARY INCREASING BY A FIXED AMOUNT EACH YEAR SUGGESTS AN ARITHMETIC SEQUENCE,

WHILE AN INVESTMENT GROWING BY A FIXED PERCENTAGE ANNUALLY POINTS TO A GEOMETRIC SEQUENCE. PRACTICE WITH A VARIETY OF WORD PROBLEMS WILL BUILD YOUR CONFIDENCE IN THESE TRANSLATIONS.

THE POWER OF PRACTICE AND REVIEW

ULTIMATELY, MASTERING COLLEGE ALGEBRA PROBLEM SOLVING SEQUENCES SERIES COMES DOWN TO CONSISTENT PRACTICE AND THOROUGH REVIEW. WORK THROUGH AS MANY EXAMPLES AS POSSIBLE, PAYING CLOSE ATTENTION TO THE STEPS INVOLVED IN EACH SOLUTION. DON'T JUST MEMORIZE FORMULAS; STRIVE TO UNDERSTAND WHY THEY WORK. REVISITING CONCEPTS PERIODICALLY WILL REINFORCE YOUR UNDERSTANDING AND MAKE COMPLEX PROBLEMS FEEL MORE APPROACHABLE. REMEMBER, EVERY SEQUENCE AND SERIES PROBLEM IS AN OPPORTUNITY TO HONE YOUR ANALYTICAL AND PROBLEM-SOLVING SKILLS.

Q: WHAT IS THE MAIN DIFFERENCE BETWEEN A SEQUENCE AND A SERIES?

A: A SEQUENCE IS AN ORDERED LIST OF NUMBERS, SUCH AS 2, 4, 6, 8. A SERIES IS THE SUM OF THE TERMS IN A SEQUENCE, SUCH AS $2 + 4 + 6 + 8$.

Q: HOW DO I DETERMINE IF A SEQUENCE IS ARITHMETIC OR GEOMETRIC?

A: TO CHECK IF A SEQUENCE IS ARITHMETIC, FIND THE DIFFERENCE BETWEEN CONSECUTIVE TERMS. IF THE DIFFERENCE IS CONSTANT, IT'S ARITHMETIC. TO CHECK IF IT'S GEOMETRIC, FIND THE RATIO OF CONSECUTIVE TERMS. IF THE RATIO IS CONSTANT, IT'S GEOMETRIC.

Q: WHAT DOES IT MEAN FOR AN INFINITE GEOMETRIC SERIES TO CONVERGE?

A: AN INFINITE GEOMETRIC SERIES CONVERGES IF ITS SUM APPROACHES A FINITE, SPECIFIC NUMBER. THIS HAPPENS WHEN THE ABSOLUTE VALUE OF THE COMMON RATIO IS LESS THAN 1 (I.E., $|r| < 1$).

Q: CAN YOU GIVE AN EXAMPLE OF A REAL-WORLD PROBLEM THAT INVOLVES AN ARITHMETIC SERIES?

A: SAVING MONEY: IF YOU SAVE \$100 IN THE FIRST MONTH, \$120 IN THE SECOND, \$140 IN THE THIRD, AND SO ON, THE TOTAL AMOUNT SAVED OVER A YEAR WOULD BE AN ARITHMETIC SERIES.

Q: WHEN WOULD I USE THE FORMULA $S_n = \frac{n}{2}(a_1 + a_n)$ VERSUS $S_n = \frac{n}{2}(2a_1 + (n-1)d)$ FOR ARITHMETIC SERIES?

A: YOU USE $S_n = \frac{n}{2}(a_1 + a_n)$ WHEN YOU KNOW THE FIRST TERM, THE LAST TERM, AND THE NUMBER OF TERMS. YOU USE $S_n = \frac{n}{2}(2a_1 + (n-1)d)$ WHEN YOU KNOW THE FIRST TERM, THE COMMON DIFFERENCE, AND THE NUMBER OF TERMS, BUT NOT NECESSARILY THE LAST TERM.

Q: WHAT HAPPENS IF THE COMMON RATIO OF AN INFINITE GEOMETRIC SERIES IS GREATER THAN OR EQUAL TO 1?

A: IF THE ABSOLUTE VALUE OF THE COMMON RATIO $|r|$ IS GREATER THAN OR EQUAL TO 1, THE INFINITE GEOMETRIC SERIES DIVERGES, MEANING ITS SUM DOES NOT APPROACH A FINITE VALUE; IT TENDS TOWARDS INFINITY OR OSCILLATES.

Q: HOW CAN I FIND THE COMMON RATIO 'R' FOR A GEOMETRIC SEQUENCE IF ONLY A FEW TERMS ARE GIVEN?

A: DIVIDE ANY TERM BY ITS PRECEDING TERM. FOR EXAMPLE, IF THE SEQUENCE IS 3, 6, 12, THE COMMON RATIO IS $6/3 = 2$ OR $12/6 = 2$.

Q: ARE THERE ANY SEQUENCES OR SERIES THAT ARE NEITHER ARITHMETIC NOR GEOMETRIC?

A: YES, ABSOLUTELY. MANY SEQUENCES FOLLOW DIFFERENT PATTERNS, SUCH AS QUADRATIC PATTERNS (WHERE THE SECOND DIFFERENCES ARE CONSTANT) OR FIBONACCI-LIKE SEQUENCES WHERE EACH TERM IS THE SUM OF THE TWO PRECEDING TERMS. THESE REQUIRE DIFFERENT APPROACHES TO PROBLEM-SOLVING.
