DECODING COMMON GENETICS TERMS: A COMPREHENSIVE OVERVIEW

GENETICS, THE STUDY OF HEREDITY, IS BUILT UPON A FOUNDATION OF SPECIFIC TERMINOLOGY THAT DESCRIBES THE FUNDAMENTAL UNITS AND PROCESSES INVOLVED IN THE TRANSMISSION OF TRAITS. UNDERSTANDING THESE COMMON GENETICS TERMS IS ESSENTIAL FOR ANYONE SEEKING TO GRASP THE COMPLEXITIES OF LIFE'S BLUEPRINT. THIS SECTION WILL INTRODUCE THE FOUNDATIONAL CONCEPTS THAT FORM THE BEDROCK OF GENETIC UNDERSTANDING.

UNDERSTANDING THE BASICS OF GENETICS

AT ITS CORE, GENETICS SEEKS TO UNRAVEL THE MYSTERY OF HOW ORGANISMS INHERIT CHARACTERISTICS FROM THEIR PARENTS. THIS INVOLVES STUDYING DNA, THE MOLECULE THAT CARRIES GENETIC INFORMATION, AND HOW THIS INFORMATION IS ORGANIZED, EXPRESSED, AND PASSED DOWN THROUGH GENERATIONS. THE FIELD HAS EVOLVED DRAMATICALLY, FROM EARLY OBSERVATIONS OF INHERITANCE PATTERNS TO THE SOPHISTICATED MOLECULAR TECHNIQUES USED TODAY TO ANALYZE AND EVEN MANIPULATE GENETIC MATERIAL.

THE SIGNIFICANCE OF GENETICS IN MODERN SCIENCE

THE INSIGHTS GAINED FROM GENETICS HAVE FAR-REACHING IMPLICATIONS ACROSS NUMEROUS SCIENTIFIC DISCIPLINES. IN MEDICINE, GENETIC UNDERSTANDING IS CRUCIAL FOR DIAGNOSING AND TREATING INHERITED DISEASES, DEVELOPING PERSONALIZED THERAPIES, AND PREDICTING DISEASE RISK. IN AGRICULTURE, GENETIC PRINCIPLES ARE APPLIED TO IMPROVE CROP YIELDS, ENHANCE NUTRITIONAL CONTENT, AND DEVELOP DISEASE-RESISTANT VARIETIES. EVOLUTIONARY BIOLOGY RELIES HEAVILY ON GENETICS TO TRACE THE HISTORY OF LIFE AND UNDERSTAND THE MECHANISMS OF ADAPTATION. EVEN IN FIELDS LIKE FORENSICS, GENETIC ANALYSIS PLAYS A VITAL ROLE IN IDENTIFICATION.

THE BUILDING BLOCKS OF HEREDITY: DNA AND GENES

THE FUNDAMENTAL UNITS OF HEREDITY ARE DNA AND GENES. THESE TERMS ARE CENTRAL TO ANY DISCUSSION OF GENETICS AND REPRESENT THE CORE INFORMATION THAT DICTATES AN ORGANISM'S TRAITS. UNDERSTANDING THEIR STRUCTURE AND FUNCTION IS PARAMOUNT TO COMPREHENDING THE ENTIRE FIELD.

DEOXYRIBONUCLEIC ACID (DNA): THE GENETIC BLUEPRINT

DEOXYRIBONUCLEIC ACID, OR DNA, IS A COMPLEX MOLECULE FOUND IN THE NUCLEUS OF EUKARYOTIC CELLS AND IN THE CYTOPLASM OF PROKARYOTIC CELLS. IT SERVES AS THE BLUEPRINT FOR LIFE, CONTAINING THE INSTRUCTIONS NEEDED FOR AN ORGANISM TO DEVELOP, SURVIVE, AND REPRODUCE. DNA IS A DOUBLE HELIX, A STRUCTURE RESEMBLING A TWISTED LADDER. THE SIDES OF THE LADDER ARE MADE OF ALTERNATING SUGAR (DEOXYRIBOSE) AND PHOSPHATE GROUPS, WHILE THE RUNGS ARE FORMED BY PAIRS OF NITROGENOUS BASES: ADENINE (A), THYMINE (T), GUANINE (G), AND CYTOSINE (C). THE SPECIFIC SEQUENCE OF THESE BASES ALONG THE DNA MOLECULE IS WHAT ENCODES GENETIC INFORMATION.

WHAT IS A GENE?

A GENE IS A SPECIFIC SEGMENT OF DNA THAT CARRIES THE INSTRUCTIONS FOR BUILDING A PARTICULAR PROTEIN OR A FUNCTIONAL RNA MOLECULE. THESE PROTEINS AND RNA MOLECULES ARE THE WORKHORSES OF THE CELL, CARRYING OUT A VAST ARRAY OF FUNCTIONS THAT ULTIMATELY DETERMINE AN ORGANISM'S TRAITS. GENES ARE NOT PHYSICALLY DISTINCT ENTITIES IN THE WAY THAT MARBLES ARE; RATHER, THEY ARE DEFINED BY THEIR SPECIFIC NUCLEOTIDE SEQUENCES AND THEIR ABILITY TO BE TRANSCRIBED AND TRANSLATED INTO FUNCTIONAL PRODUCTS. THE HUMAN GENOME, FOR INSTANCE, CONTAINS TENS OF THOUSANDS OF GENES.

THE CENTRAL DOGMA OF MOLECULAR BIOLOGY

THE CENTRAL DOGMA DESCRIBES THE FLOW OF GENETIC INFORMATION WITHIN A BIOLOGICAL SYSTEM. IT STATES THAT INFORMATION FLOWS FROM DNA TO RNA AND THEN TO PROTEIN. THIS PROCESS INVOLVES TWO MAIN STEPS: TRANSCRIPTION, WHERE A SEGMENT OF DNA IS COPIED INTO A MESSENGER RNA (mRNA) MOLECULE, AND TRANSLATION, WHERE THE mRNA SEQUENCE IS USED AS A TEMPLATE TO SYNTHESIZE A PROTEIN. WHILE THERE ARE EXCEPTIONS, THE CENTRAL DOGMA PROVIDES A FUNDAMENTAL FRAMEWORK FOR UNDERSTANDING HOW GENETIC INFORMATION IS UTILIZED.

CODONS: THE GENETIC LANGUAGE

THE SEQUENCE OF DNA BASES IS READ IN GROUPS OF THREE CALLED CODONS. EACH CODON SPECIFIES A PARTICULAR AMINO ACID, WHICH ARE THE BUILDING BLOCKS OF PROTEINS, OR SIGNALS THE START OR END OF PROTEIN SYNTHESIS. FOR EXAMPLE, THE

CODON AUG SIGNALS THE START OF TRANSLATION AND ALSO CODES FOR THE AMINO ACID METHIONINE. THE GENETIC CODE IS REMARKABLY CONSERVED ACROSS MOST LIVING ORGANISMS, HIGHLIGHTING A SHARED EVOLUTIONARY HISTORY.

CHROMOSOMES: THE ORGANIZERS OF GENETIC MATERIAL

WITHIN THE CELL NUCLEUS, DNA IS METICULOUSLY ORGANIZED INTO STRUCTURES CALLED CHROMOSOMES. THESE ORGANIZED UNITS ENSURE THAT GENETIC MATERIAL IS ACCURATELY REPLICATED AND DISTRIBUTED DURING CELL DIVISION. UNDERSTANDING CHROMOSOME STRUCTURE AND NUMBER IS CRUCIAL FOR COMPREHENDING INHERITANCE AND GENETIC DISORDERS.

WHAT IS A CHROMOSOME?

A CHROMOSOME IS A THREAD-LIKE STRUCTURE COMPOSED OF DNA TIGHTLY COILED AROUND PROTEINS CALLED HISTONES. THIS COILING ALLOWS THE VAST AMOUNT OF DNA WITHIN A CELL TO FIT INTO THE MICROSCOPIC NUCLEUS. EACH CHROMOSOME CONTAINS MANY GENES. HUMANS TYPICALLY HAVE 23 PAIRS OF CHROMOSOMES IN EACH SOMATIC CELL (46 IN TOTAL), WITH ONE SET INHERITED FROM EACH PARENT.

HOMOLOGOUS CHROMOSOMES

HOMOLOGOUS CHROMOSOMES ARE PAIRS OF CHROMOSOMES THAT HAVE THE SAME GENES IN THE SAME ORDER, BUT MAY HAVE DIFFERENT VERSIONS (ALLELES) OF THOSE GENES. ONE CHROMOSOME IN THE PAIR COMES FROM THE MOTHER, AND THE OTHER COMES FROM THE FATHER. THEY ARE CRUCIAL FOR SEXUAL REPRODUCTION, AS THEY ENSURE THAT OFFSPRING RECEIVE A COMPLETE SET OF GENETIC INSTRUCTIONS.

AUTOSOMES AND SEX CHROMOSOMES

HUMAN CHROMOSOMES CAN BE CATEGORIZED INTO TWO TYPES: AUTOSOMES AND SEX CHROMOSOMES. AUTOSOMES ARE THE NON-SEX CHROMOSOMES, AND THERE ARE 22 PAIRS OF THEM. SEX CHROMOSOMES, DENOTED AS X AND Y, DETERMINE AN INDIVIDUAL'S BIOLOGICAL SEX. FEMALES TYPICALLY HAVE TWO X CHROMOSOMES (XX), WHILE MALES TYPICALLY HAVE ONE X AND ONE Y CHROMOSOME (XY).

KARYOTYPE: THE CHROMOSOMAL PORTRAIT

A KARYOTYPE IS AN ORGANIZED PROFILE OF A PERSON'S CHROMOSOMES, ARRANGED IN HOMOLOGOUS PAIRS AND ORDERED BY SIZE, FROM LARGEST TO SMALLEST. THIS VISUAL REPRESENTATION IS USED TO IDENTIFY CHROMOSOMAL ABNORMALITIES, SUCH AS EXTRA CHROMOSOMES, MISSING CHROMOSOMES, OR STRUCTURAL CHANGES WITHIN CHROMOSOMES, WHICH CAN LEAD TO VARIOUS GENETIC CONDITIONS.

ALLELES: THE VARIANTS OF GENES

ALLELES ARE DIFFERENT VERSIONS OF THE SAME GENE. THEY ARISE THROUGH MUTATIONS AND PROVIDE THE GENETIC VARIATION THAT IS ESSENTIAL FOR EVOLUTION AND THE DIVERSITY OF TRAITS OBSERVED IN POPULATIONS. THE INTERACTION OF DIFFERENT ALLELES DETERMINES AN INDIVIDUAL'S OBSERVABLE CHARACTERISTICS.

DEFINING ALLELES

AS MENTIONED, ALLELES ARE ALTERNATIVE FORMS OF A GENE LOCATED AT THE SAME LOCUS (POSITION) ON HOMOLOGOUS CHROMOSOMES. FOR EXAMPLE, THE GENE FOR EYE COLOR MIGHT HAVE AN ALLELE FOR BROWN EYES AND ANOTHER ALLELE FOR BLUE EYES.

DOMINANT AND RECESSIVE ALLELES

WHEN AN INDIVIDUAL INHERITS TWO DIFFERENT ALLELES FOR A GENE, ONE ALLELE MAY MASK THE EFFECT OF THE OTHER. A DOMINANT ALLELE EXPRESSES ITS TRAIT EVEN IF ONLY ONE COPY IS PRESENT, WHILE A RECESSIVE ALLELE ONLY EXPRESSES ITS TRAIT IF TWO COPIES ARE PRESENT. THIS CONCEPT IS FUNDAMENTAL TO UNDERSTANDING SIMPLE MENDELIAN INHERITANCE.

HOMOZYGOUS AND HETEROZYGOUS GENOTYPES

AN INDIVIDUAL'S GENETIC MAKEUP FOR A PARTICULAR GENE IS DESCRIBED BY THEIR GENOTYPE. IF AN INDIVIDUAL HAS TWO IDENTICAL ALLELES FOR A GENE, THEY ARE SAID TO BE HOMOZYGOUS FOR THAT GENE. IF THEY HAVE TWO DIFFERENT ALLELES, THEY ARE HETEROZYGOUS. FOR EXAMPLE, IF 'B' REPRESENTS THE DOMINANT ALLELE FOR BROWN EYES AND 'b' REPRESENTS THE RECESSIVE ALLELE FOR BLUE EYES, AN INDIVIDUAL WITH GENOTYPE BB OR bb IS HOMOZYGOUS, WHILE AN INDIVIDUAL WITH GENOTYPE Bb IS HETEROZYGOUS.

GENOTYPE AND PHENOTYPE: THE BLUEPRINT AND THE EXPRESSION

THE DISTINCTION BETWEEN GENOTYPE AND PHENOTYPE IS A CORNERSTONE OF GENETICS, ILLUSTRATING THE DIFFERENCE BETWEEN AN ORGANISM'S GENETIC MAKEUP AND ITS OBSERVABLE PHYSICAL CHARACTERISTICS.

GENOTYPE: THE GENETIC CONSTITUTION

GENOTYPE REFERS TO THE SPECIFIC SET OF ALLELES AN ORGANISM POSSESSES FOR A PARTICULAR TRAIT OR SET OF TRAITS. IT IS THE INTERNAL GENETIC INFORMATION. FOR EXAMPLE, THE GENOTYPE FOR A PEA PLANT'S FLOWER COLOR MIGHT BE PP (HOMOZYGOUS DOMINANT), pp (HOMOZYGOUS RECESSIVE), OR Pp (HETEROZYGOUS).

PHENOTYPE: THE OBSERVABLE TRAITS

PHENOTYPE, ON THE OTHER HAND, IS THE OBSERVABLE PHYSICAL OR BIOCHEMICAL CHARACTERISTICS OF AN ORGANISM THAT RESULT FROM THE INTERACTION OF ITS GENOTYPE WITH THE ENVIRONMENT. IN THE PEA PLANT EXAMPLE, IF PURPLE FLOWERS (P) ARE DOMINANT OVER WHITE FLOWERS (p), THEN PLANTS WITH GENOTYPES PP AND Pp WILL HAVE PURPLE FLOWERS (PHENOTYPE), WHILE PLANTS WITH GENOTYPE pp WILL HAVE WHITE FLOWERS (PHENOTYPE).

THE GENOTYPE-PHENOTYPE RELATIONSHIP

THE RELATIONSHIP BETWEEN GENOTYPE AND PHENOTYPE IS NOT ALWAYS STRAIGHTFORWARD. ENVIRONMENTAL FACTORS CAN SIGNIFICANTLY INFLUENCE HOW A GENOTYPE IS EXPRESSED. FOR INSTANCE, A PERSON MIGHT HAVE A GENETIC PREDISPOSITION FOR A CERTAIN HEIGHT (GENOTYPE), BUT THEIR ACTUAL ADULT HEIGHT (PHENOTYPE) CAN BE AFFECTED BY NUTRITION AND OVERALL

HEALTH DURING THEIR GROWTH YEARS.

INHERITANCE PATTERNS: HOW TRAITS ARE PASSED DOWN

THE STUDY OF INHERITANCE PATTERNS, PIONEERED BY GREGOR MENDEL, REVEALS THE PREDICTABLE WAYS IN WHICH TRAITS ARE TRANSMITTED FROM PARENTS TO OFFSPRING. THESE PATTERNS ARE GOVERNED BY THE BEHAVIOR OF CHROMOSOMES AND ALLELES DURING REPRODUCTION.

MENDELIAN INHERITANCE

MENDELIAN INHERITANCE DESCRIBES THE SIMPLE PATTERNS OF HEREDITY THAT FOLLOW MENDEL'S LAWS. THESE LAWS INCLUDE THE LAW OF SEGREGATION, WHICH STATES THAT EACH INDIVIDUAL HAS TWO ALLELES FOR EACH TRAIT, AND THESE ALLELES SEPARATE DURING GAMETE FORMATION, SO THAT EACH GAMETE CARRIES ONLY ONE ALLELE. THE LAW OF INDEPENDENT ASSORTMENT STATES THAT ALLELES FOR DIFFERENT TRAITS SEGREGATE INDEPENDENTLY OF EACH OTHER DURING GAMETE FORMATION, PROVIDED THEY ARE ON DIFFERENT CHROMOSOMES.

NON-MENDELIAN INHERITANCE

WHILE MENDELIAN INHERITANCE PROVIDES A FOUNDATIONAL UNDERSTANDING, MANY TRAITS DO NOT FOLLOW THESE SIMPLE PATTERNS. NON-MENDELIAN INHERITANCE INCLUDES CONCEPTS LIKE:

- INCOMPLETE DOMINANCE: WHERE NEITHER ALLELE IS COMPLETELY DOMINANT, RESULTING IN A BLENDED PHENOTYPE (E.G., PINK FLOWERS FROM RED AND WHITE PARENTS).
- CODOMINANCE: WHERE BOTH ALLELES ARE EXPRESSED SIMULTANEOUSLY IN THE PHENOTYPE (E.G., BLOOD TYPES AB).
- POLYGENIC INHERITANCE: WHERE A TRAIT IS INFLUENCED BY MULTIPLE GENES, LEADING TO A CONTINUOUS RANGE OF PHENOTYPES (E.G., HEIGHT, SKIN COLOR).
- SEX-LINKED INHERITANCE: WHERE GENES ARE LOCATED ON THE SEX CHROMOSOMES, LEADING TO DIFFERENT INHERITANCE PATTERNS IN MALES AND FEMALES (E.G., COLOR BLINDNESS).

PEDIGREE ANALYSIS

A PEDIGREE IS A CHART THAT DEPICTS THE GENETIC RELATIONSHIPS AMONG MEMBERS OF A FAMILY, SHOWING THE INHERITANCE OF A PARTICULAR TRAIT OVER SEVERAL GENERATIONS. GENETICISTS USE PEDIGREE ANALYSIS TO DETERMINE THE MODE OF INHERITANCE OF GENETIC DISORDERS AND TO TRACK THE TRANSMISSION OF GENES WITHIN FAMILIES.

MUTATIONS: CHANGES IN THE GENETIC CODE

MUTATIONS ARE ALTERATIONS IN THE DNA SEQUENCE THAT CAN OCCUR SPONTANEOUSLY OR BE INDUCED BY ENVIRONMENTAL FACTORS. WHILE OFTEN PERCEIVED NEGATIVELY, MUTATIONS ARE THE ULTIMATE SOURCE OF GENETIC VARIATION AND ARE ESSENTIAL FOR EVOLUTION.

TYPES OF MUTATIONS

MUTATIONS CAN BE BROADLY CLASSIFIED AS:

- POINT MUTATIONS: CHANGES TO A SINGLE NUCLEOTIDE BASE, SUCH AS SUBSTITUTIONS, INSERTIONS, OR DELETIONS.
- CHROMOSOMAL MUTATIONS: LARGER-SCALE CHANGES AFFECTING THE STRUCTURE OR NUMBER OF CHROMOSOMES, SUCH AS DELETIONS, DUPLICATIONS, INVERSIONS, OR TRANSLOCATIONS.

CAUSES OF MUTATIONS

MUTATIONS CAN ARISE SPONTANEOUSLY DUE TO ERRORS DURING DNA REPLICATION OR REPAIR. THEY CAN ALSO BE INDUCED BY MUTAGENS, WHICH ARE ENVIRONMENTAL AGENTS THAT DAMAGE DNA, SUCH AS CERTAIN CHEMICALS (E.G., CIGARETTE SMOKE) AND RADIATION (E.G., UV LIGHT, X-RAYS).

THE IMPACT OF MUTATIONS

THE IMPACT OF A MUTATION DEPENDS ON WHERE IT OCCURS IN THE DNA AND THE SPECIFIC CHANGE IT CAUSES. SOME MUTATIONS HAVE NO OBSERVABLE EFFECT (SILENT MUTATIONS), WHILE OTHERS CAN LEAD TO ALTERED PROTEIN FUNCTION, RESULTING IN GENETIC DISORDERS OR EVEN BENEFICIAL TRAITS. THE LOCATION OF A MUTATION WITHIN A GENE (CODING VS. NON-CODING REGIONS) AND ITS EFFECT ON THE PROTEIN SEQUENCE ARE CRITICAL FACTORS.

GENETIC VARIATION AND EVOLUTION

GENETIC VARIATION IS THE RAW MATERIAL FOR EVOLUTION. THE DIVERSITY OF ALLELES WITHIN A POPULATION PROVIDES THE BASIS FOR NATURAL SELECTION TO ACT UPON, ALLOWING SPECIES TO ADAPT TO CHANGING ENVIRONMENTS OVER TIME.

SOURCES OF GENETIC VARIATION

THE PRIMARY SOURCES OF GENETIC VARIATION IN SEXUALLY REPRODUCING ORGANISMS ARE:

- MUTATION: AS DISCUSSED, MUTATIONS INTRODUCE NEW ALLELES INTO A GENE POOL.
- GENE FLOW: THE MOVEMENT OF GENES BETWEEN POPULATIONS THROUGH MIGRATION OF INDIVIDUALS.
- SEXUAL REPRODUCTION: THE SHUFFLING OF EXISTING ALLELES THROUGH RECOMBINATION DURING MEIOSIS AND THE RANDOM COMBINATION OF GAMETES DURING FERTILIZATION.

NATURAL SELECTION AND ADAPTATION

NATURAL SELECTION IS THE PROCESS BY WHICH ORGANISMS WITH TRAITS BETTER SUITED TO THEIR ENVIRONMENT TEND TO SURVIVE AND REPRODUCE MORE SUCCESSFULLY, PASSING ON THOSE ADVANTAGEOUS TRAITS TO THEIR OFFSPRING. OVER

GENERATIONS, THIS LEADS TO ADAPTATION, WHERE POPULATIONS BECOME BETTER FITTED TO THEIR SPECIFIC ECOLOGICAL NICHES.

GENETIC DRIFT

GENETIC DRIFT IS ANOTHER MECHANISM OF EVOLUTION, PARTICULARLY INFLUENTIAL IN SMALL POPULATIONS. IT REFERS TO RANDOM FLUCTUATIONS IN ALLELE FREQUENCIES FROM ONE GENERATION TO THE NEXT, PURELY BY CHANCE. THIS CAN LEAD TO THE LOSS OF CERTAIN ALLELES OR THE FIXATION OF OTHERS, REGARDLESS OF THEIR ADAPTIVE VALUE.

GENETIC TECHNOLOGIES AND APPLICATIONS

ADVANCES IN GENETICS HAVE LED TO POWERFUL TECHNOLOGIES THAT ALLOW US TO STUDY, ANALYZE, AND EVEN MANIPULATE GENETIC MATERIAL, OPENING UP A WIDE RANGE OF APPLICATIONS.

DNA SEQUENCING

DNA SEQUENCING IS A PROCESS THAT DETERMINES THE PRECISE ORDER OF NUCLEOTIDES (A, T, C, G) IN A DNA MOLECULE. THIS TECHNOLOGY HAS REVOLUTIONIZED BIOLOGICAL RESEARCH, ENABLING US TO READ THE GENETIC CODE OF ORGANISMS, IDENTIFY GENES, AND UNDERSTAND GENETIC VARIATIONS ASSOCIATED WITH DISEASES.

GENETIC ENGINEERING

GENETIC ENGINEERING INVOLVES THE DIRECT MANIPULATION OF AN ORGANISM'S GENES USING BIOTECHNOLOGY. THIS CAN INCLUDE INTRODUCING NEW GENES, DELETING EXISTING ONES, OR MODIFYING GENE EXPRESSION TO ACHIEVE DESIRED TRAITS IN CROPS, BACTERIA, OR EVEN FOR THERAPEUTIC PURPOSES IN HUMANS (GENE THERAPY).

CRISPR-Cas9

CRISPR-Cas9 IS A REVOLUTIONARY GENE-EDITING TECHNOLOGY THAT ALLOWS SCIENTISTS TO PRECISELY TARGET AND MODIFY DNA SEQUENCES. IT ACTS LIKE MOLECULAR SCISSORS, ENABLING THE DELETION, INSERTION, OR ALTERATION OF SPECIFIC GENES WITH UNPRECEDENTED ACCURACY AND EFFICIENCY, HOLDING IMMENSE POTENTIAL FOR TREATING GENETIC DISEASES.

FORENSIC GENETICS

FORENSIC GENETICS UTILIZES DNA ANALYSIS TO IDENTIFY INDIVIDUALS FOR LEGAL PURPOSES. DNA PROFILING, OFTEN USING SHORT TANDEM REPEATS (STRs), CREATES A UNIQUE GENETIC FINGERPRINT THAT CAN LINK SUSPECTS TO CRIME SCENES OR ESTABLISH FAMILIAL RELATIONSHIPS.

CONCLUSION: MASTERING COMMON GENETICS TERMS

A FIRM GRASP OF COMMON GENETICS TERMS IS NOT JUST FOR SCIENTISTS; IT'S FOR ANYONE SEEKING TO UNDERSTAND THE

FREQUENTLY ASKED QUESTIONS

WHAT IS THE DIFFERENCE BETWEEN A GENE AND AN ALLELE?

A GENE IS A SEGMENT OF DNA THAT CODES FOR A SPECIFIC TRAIT, LIKE EYE COLOR. AN ALLELE IS A SPECIFIC VERSION OF THAT GENE, SUCH AS THE ALLELE FOR BLUE EYES OR BROWN EYES.

CAN YOU EXPLAIN GENOTYPE AND PHENOTYPE IN SIMPLE TERMS?

GENOTYPE IS YOUR GENETIC MAKEUP, THE ACTUAL COMBINATION OF ALLELES YOU HAVE FOR A TRAIT (E.G., BB, Bb, OR bb FOR EYE COLOR). PHENOTYPE IS THE OBSERVABLE CHARACTERISTIC THAT RESULTS FROM YOUR GENOTYPE (E.G., HAVING BROWN EYES).

WHAT DOES IT MEAN FOR A TRAIT TO BE DOMINANT OR RECESSIVE?

A DOMINANT TRAIT WILL BE EXPRESSED EVEN IF ONLY ONE COPY OF THE DOMINANT ALLELE IS PRESENT. A RECESSIVE TRAIT WILL ONLY BE EXPRESSED IF AN INDIVIDUAL HAS TWO COPIES OF THE RECESSIVE ALLELE.

HOW DOES DNA REPLICATION WORK?

DNA REPLICATION IS THE PROCESS WHERE A CELL MAKES AN IDENTICAL COPY OF ITS DNA. ENZYMES UNWIND THE DNA HELIX, AND NEW NUCLEOTIDES ARE ADDED TO EACH STRAND, CREATING TWO NEW DOUBLE-STRANDED DNA MOLECULES.

WHAT IS A MUTATION AND WHAT CAUSES THEM?

A MUTATION IS A CHANGE IN THE DNA SEQUENCE. THEY CAN BE CAUSED BY ERRORS DURING DNA REPLICATION, EXPOSURE TO RADIATION OR CERTAIN CHEMICALS, OR VIRAL INFECTIONS.

EXPLAIN THE CONCEPT OF HOMOLOGOUS CHROMOSOMES.

HOMOLOGOUS CHROMOSOMES ARE PAIRS OF CHROMOSOMES IN A DIPLOID ORGANISM THAT HAVE THE SAME GENES IN THE SAME ORDER, THOUGH THE SPECIFIC ALLELES MAY DIFFER. ONE CHROMOSOME IN THE PAIR COMES FROM EACH PARENT.

WHAT IS THE FUNCTION OF RIBOSOMES IN GENETICS?

RIBOSOMES ARE CELLULAR MACHINERY RESPONSIBLE FOR PROTEIN SYNTHESIS. THEY READ THE MESSENGER RNA (mRNA) SEQUENCE AND ASSEMBLE AMINO ACIDS INTO PROTEINS BASED ON THAT GENETIC CODE.

WHAT IS THE CENTRAL DOGMA OF MOLECULAR BIOLOGY?

THE CENTRAL DOGMA DESCRIBES THE FLOW OF GENETIC INFORMATION: DNA IS TRANSCRIBED INTO RNA, AND RNA IS TRANSLATED INTO PROTEIN. THIS IS OFTEN SUMMARIZED AS DNA → RNA → PROTEIN.

WHAT IS A PUNNETT SQUARE USED FOR?

A PUNNETT SQUARE IS A DIAGRAM USED TO PREDICT THE POSSIBLE GENOTYPES AND PHENOTYPES OF OFFSPRING FROM A GENETIC CROSS BETWEEN TWO PARENTS.

HOW DOES EPIGENETICS DIFFER FROM GENETICS?

GENETICS REFERS TO THE SEQUENCE OF DNA ITSELF. EPIGENETICS INVOLVES CHANGES IN GENE EXPRESSION THAT DO NOT INVOLVE ALTERATIONS TO THE DNA SEQUENCE, OFTEN THROUGH MODIFICATIONS TO DNA OR ASSOCIATED PROTEINS.
