

# CORE FOOD CHEMISTRY CONCEPTS

THE EXPLORATION OF **CORE FOOD CHEMISTRY CONCEPTS** IS FUNDAMENTAL TO UNDERSTANDING WHY OUR FOOD TASTES, SMELLS, LOOKS, AND BEHAVES THE WAY IT DOES. FROM THE BROWNING OF BREAD TO THE CRISPNESS OF A FRESH APPLE, CHEMISTRY IS AT PLAY, SHAPING OUR CULINARY EXPERIENCES. THIS ARTICLE WILL DELVE INTO THE ESSENTIAL BUILDING BLOCKS OF FOOD, EXAMINING THE ROLES OF MACRONUTRIENTS, FLAVOR COMPOUNDS, AND THE FASCINATING CHEMICAL TRANSFORMATIONS THAT OCCUR DURING COOKING AND STORAGE. WE'LL UNCOVER THE INTRICATE INTERPLAY OF WATER, CARBOHYDRATES, LIPIDS, PROTEINS, AND VITAMINS, AND HOW THEIR INTERACTIONS CREATE THE COMPLEX MATRICES WE ENJOY. BY UNDERSTANDING THESE FUNDAMENTAL PRINCIPLES, WE GAIN A DEEPER APPRECIATION FOR THE SCIENCE BEHIND OUR SUSTENANCE AND UNLOCK THE SECRETS TO BETTER FOOD PREPARATION AND PRESERVATION.

## THE ESSENTIAL MACROMOLECULES OF FOOD

AT THE HEART OF EVERY EDIBLE SUBSTANCE LIE THE CRUCIAL MACROMOLECULES THAT PROVIDE ITS STRUCTURE, ENERGY, AND SENSORY ATTRIBUTES. THESE ARE THE LARGE, COMPLEX MOLECULES THAT FORM THE BACKBONE OF OUR DIET. UNDERSTANDING THEIR INDIVIDUAL PROPERTIES AND HOW THEY INTERACT IS KEY TO GRASPING THE NUANCES OF FOOD SCIENCE. THESE VITAL COMPONENTS ARE PRIMARILY CARBOHYDRATES, LIPIDS, AND PROTEINS, EACH PLAYING A DISTINCT AND INDISPENSABLE ROLE IN THE OVERALL COMPOSITION AND BEHAVIOR OF FOOD.

## WATER: THE UNIVERSAL SOLVENT IN FOOD

WATER IS PERHAPS THE MOST ABUNDANT AND CRITICAL COMPONENT IN MOST FOODS, OFTEN COMPRISING OVER HALF OF THEIR WEIGHT. ITS UNIQUE PROPERTIES AS A POLAR MOLECULE MAKE IT AN EXCEPTIONAL SOLVENT, ALLOWING IT TO DISSOLVE SUGARS, SALTS, AND MANY OTHER FLAVOR COMPOUNDS. THIS DISSOLUTION IS ESSENTIAL FOR TASTE PERCEPTION AND FOR FACILITATING CHEMICAL REACTIONS WITHIN FOOD. THE STATE OF WATER—WHETHER FREE OR BOUND—SIGNIFICANTLY IMPACTS A FOOD'S TEXTURE, SHELF LIFE, AND SUSCEPTIBILITY TO MICROBIAL GROWTH. FREE WATER IS READILY AVAILABLE FOR CHEMICAL REACTIONS AND MICROBIAL ACTIVITY, WHILE BOUND WATER IS HELD TIGHTLY BY OTHER FOOD MOLECULES, MAKING IT LESS REACTIVE.

## THE ROLE OF WATER ACTIVITY

WATER ACTIVITY, OFTEN DENOTED AS  $A_w$ , IS A MEASURE OF THE UNBOUND WATER AVAILABLE IN A FOOD PRODUCT. IT IS A CRITICAL FACTOR IN DETERMINING MICROBIAL STABILITY AND THE RATE OF CHEMICAL REACTIONS. FOODS WITH A LOW WATER

ACTIVITY, SUCH AS DRIED FRUITS OR CRACKERS, ARE LESS PRONE TO SPOILAGE BECAUSE THE LIMITED AVAILABILITY OF FREE WATER INHIBITS THE GROWTH OF BACTERIA, YEASTS, AND MOLDS. CONVERSELY, HIGH WATER ACTIVITY FOODS, LIKE FRESH PRODUCE OR DAIRY PRODUCTS, REQUIRE CAREFUL HANDLING AND PRESERVATION METHODS TO PREVENT SPOILAGE.

## WATER'S IMPACT ON TEXTURE

THE PRESENCE AND STATE OF WATER PROFOUNDLY INFLUENCE THE TEXTURAL CHARACTERISTICS OF FOOD. IN FRUITS AND VEGETABLES, TURGOR PRESSURE, MAINTAINED BY WATER, GIVES THEM THEIR CRISPNESS AND FIRMNESS. IN COOKED MEATS, THE DENATURATION OF PROTEINS CAN LEAD TO WATER LOSS, RESULTING IN A DRIER, TOUGHER PRODUCT. UNDERSTANDING HOW WATER INTERACTS WITH OTHER FOOD COMPONENTS, SUCH AS STARCHES AND PROTEINS, ALLOWS US TO MANIPULATE TEXTURE THROUGH COOKING TECHNIQUES AND PROCESSING.

## CARBOHYDRATES: SWEETNESS, STRUCTURE, AND BROWNING

CARBOHYDRATES ARE A DIVERSE GROUP OF ORGANIC COMPOUNDS THAT SERVE AS A PRIMARY SOURCE OF ENERGY IN OUR DIET. THEY RANGE FROM SIMPLE SUGARS LIKE GLUCOSE AND FRUCTOSE TO COMPLEX POLYSACCHARIDES SUCH AS STARCH AND CELLULOSE. IN FOOD, CARBOHYDRATES CONTRIBUTE SWEETNESS, PROVIDE STRUCTURE TO BAKED GOODS, AND ARE KEY PLAYERS IN IMPORTANT BROWNING REACTIONS.

### SIMPLE SUGARS AND SWEETNESS

MONOSACCHARIDES LIKE GLUCOSE AND FRUCTOSE, AND DISACCHARIDES LIKE SUCROSE (TABLE SUGAR), ARE RESPONSIBLE FOR THE SWEET TASTE IN FOODS. THEIR DIFFERENT CHEMICAL STRUCTURES LEAD TO VARYING DEGREES OF SWEETNESS. FRUCTOSE, FOR INSTANCE, IS SWEETER THAN GLUCOSE. THE INTERACTION OF THESE SUGARS WITH TASTE RECEPTORS ON OUR TONGUE IS A DIRECT EXAMPLE OF FOOD CHEMISTRY IN ACTION.

### COMPLEX CARBOHYDRATES AND TEXTURE

POLYSACCHARIDES, SUCH AS STARCH FOUND IN GRAINS AND POTATOES, AND CELLULOSE IN PLANT CELL WALLS, PLAY A SIGNIFICANT ROLE IN FOOD TEXTURE. STARCH GELATINIZES WHEN HEATED IN THE PRESENCE OF WATER, THICKENING SAUCES AND PROVIDING STRUCTURE TO BAKED PRODUCTS. CELLULOSE, WHILE INDIGESTIBLE, CONTRIBUTES DIETARY FIBER AND ADDS BULK AND TEXTURE TO PLANT-BASED FOODS.

### THE MAILLARD REACTION AND CARAMELIZATION

CARBOHYDRATES ARE CENTRAL TO TWO CRITICAL BROWNING REACTIONS. THE MAILLARD REACTION INVOLVES THE INTERACTION OF REDUCING SUGARS WITH AMINO ACIDS, PRODUCING HUNDREDS OF FLAVOR AND AROMA COMPOUNDS RESPONSIBLE FOR THE DESIRABLE BROWN COLOR AND RICH FLAVORS IN ROASTED MEATS, BAKED BREAD, AND COFFEE. CARAMELIZATION, ON THE OTHER HAND, IS THE BROWNING OF SUGARS WHEN HEATED IN THE ABSENCE OF AMINO ACIDS, RESULTING IN A SWEET, NUTTY FLAVOR AND A DEEP BROWN HUE.

## LIPIDS: FATS, OILS, AND FLAVOR CARRIERS

LIPIDS, COMMONLY KNOWN AS FATS AND OILS, ARE ESSENTIAL COMPONENTS OF FOOD THAT PROVIDE ENERGY, CARRY FAT-SOLUBLE VITAMINS, AND CONTRIBUTE SIGNIFICANTLY TO FLAVOR AND TEXTURE. THEY ARE CHARACTERIZED BY THEIR INSOLUBILITY IN WATER AND THEIR GREASY FEEL. THE TYPE OF FATTY ACIDS THAT MAKE UP A LIPID—WHETHER SATURATED, MONOUNSATURATED, OR POLYUNSATURATED—DETERMINES ITS PHYSICAL PROPERTIES AND HEALTH IMPLICATIONS.

## THE STRUCTURE OF FATS

FATS ARE TYPICALLY TRIGLYCERIDES, FORMED FROM A GLYCEROL MOLECULE BONDED TO THREE FATTY ACID CHAINS. THE LENGTH AND DEGREE OF SATURATION OF THESE FATTY ACID CHAINS INFLUENCE WHETHER A LIPID IS SOLID AT ROOM TEMPERATURE (LIKE BUTTER, WITH MORE SATURATED FATS) OR LIQUID (LIKE OLIVE OIL, WITH MORE UNSATURATED FATS).

## LIPIDS AS FLAVOR ENHANCERS

LIPIDS ARE EXCELLENT CARRIERS OF FLAVOR COMPOUNDS, MANY OF WHICH ARE FAT-SOLUBLE. WHEN WE CONSUME FATTY FOODS, THESE FLAVOR MOLECULES ARE RELEASED IN THE MOUTH, CONTRIBUTING TO THE OVERALL TASTE EXPERIENCE. THE MOUTHFEEL PROVIDED BY FATS, WHETHER SMOOTH, CREAMY, OR CRISP, ALSO PLAYS A CRUCIAL ROLE IN OUR PERCEPTION OF FOOD QUALITY.

## LIPID OXIDATION

A SIGNIFICANT CHEMICAL CONCERN WITH LIPIDS IS OXIDATION. UNSATURATED FATTY ACIDS ARE SUSCEPTIBLE TO REACTION WITH OXYGEN, LEADING TO THE FORMATION OF OFF-FLAVORS AND AROMAS, A PROCESS KNOWN AS RANCIDITY. THIS PROCESS CAN BE ACCELERATED BY HEAT, LIGHT, AND THE PRESENCE OF METAL IONS, IMPACTING THE SHELF LIFE AND PALATABILITY OF MANY FOOD PRODUCTS.

## PROTEINS: BUILDING BLOCKS, TEXTURE, AND EMULSIFICATION

PROTEINS ARE COMPLEX MACROMOLECULES MADE UP OF AMINO ACIDS, SERVING AS THE FUNDAMENTAL BUILDING BLOCKS OF ENZYMES, ANTIBODIES, AND STRUCTURAL COMPONENTS IN LIVING ORGANISMS. IN FOOD, THEY ARE VITAL FOR NUTRITION, CONTRIBUTE TO TEXTURE, AND PLAY A ROLE IN EMULSIFICATION AND GELATION.

## AMINO ACIDS AND PROTEIN STRUCTURE

THERE ARE 20 COMMON AMINO ACIDS, AND THEIR SEQUENCE AND ARRANGEMENT DETERMINE THE UNIQUE PROPERTIES OF EACH PROTEIN. THE FOLDING OF A PROTEIN INTO A SPECIFIC THREE-DIMENSIONAL STRUCTURE IS CRUCIAL FOR ITS FUNCTION AND HOW IT BEHAVES IN FOOD. DENATURATION, THE UNFOLDING OF THESE STRUCTURES BY HEAT, ACID, OR MECHANICAL ACTION, CAN DRAMATICALLY ALTER A FOOD'S TEXTURE AND COOKING BEHAVIOR.

## PROTEINS AND FOOD TEXTURE

PROTEINS ARE MAJOR CONTRIBUTORS TO THE TEXTURE OF MANY FOODS. FOR INSTANCE, GLUTEN IN WHEAT FLOUR FORMS A NETWORK THAT GIVES BREAD ITS STRUCTURE AND CHEWINESS. THE DENATURATION AND AGGREGATION OF PROTEINS IN MEAT DURING COOKING CONTRIBUTE TO ITS FIRMNESS. IN DAIRY PRODUCTS, PROTEINS ARE RESPONSIBLE FOR THE CREAMY TEXTURE OF YOGURT AND THE FIRMNESS OF CHEESE.

## EMULSIFICATION AND FOAMING

CERTAIN PROTEINS HAVE AMPHIPHILIC PROPERTIES, MEANING THEY HAVE BOTH WATER-ATTRACTING AND FAT-ATTRACTING PARTS. THIS ALLOWS THEM TO ACT AS EMULSIFIERS, STABILIZING MIXTURES OF OIL AND WATER, SUCH AS IN MAYONNAISE OR SALAD DRESSINGS. PROTEINS CAN ALSO TRAP AIR, CREATING FOAMS, AS SEEN IN WHIPPED CREAM OR MERINGUES.

## THE CHEMISTRY OF FLAVOR AND AROMA

THE DELIGHTFUL SYMPHONY OF FLAVORS AND AROMAS WE EXPERIENCE WHEN EATING IS A DIRECT RESULT OF COMPLEX CHEMICAL COMPOUNDS INTERACTING WITH OUR SENSORY RECEPTORS. WHILE TASTE PRIMARILY REFERS TO SENSATIONS PERCEIVED BY THE TONGUE (SWEET, SOUR, SALTY, BITTER, UMAMI), AROMA INVOLVES VOLATILE COMPOUNDS DETECTED BY THE OLFACTORY SYSTEM IN THE NOSE.

## VOLATILE ORGANIC COMPOUNDS (VOCs)

A VAST ARRAY OF VOLATILE ORGANIC COMPOUNDS, OFTEN PRESENT IN TRACE AMOUNTS, ARE RESPONSIBLE FOR THE CHARACTERISTIC AROMAS OF FOODS. THESE CAN INCLUDE ALDEHYDES, KETONES, ESTERS, AND SULFUR-CONTAINING COMPOUNDS. FOR EXAMPLE, THE DISTINCTIVE SMELL OF STRAWBERRIES IS DUE TO A COMBINATION OF ESTERS, WHILE THE PUNGENT AROMA OF GARLIC IS ATTRIBUTED TO SULFUR COMPOUNDS.

## TASTE PERCEPTION

TASTE PERCEPTION IS MEDIATED BY SPECIFIC TASTE RECEPTORS ON THE TONGUE THAT BIND TO DIFFERENT TYPES OF MOLECULES. SUGARS TRIGGER SWEET RECEPTORS, ACIDS TRIGGER SOUR RECEPTORS, SALTS TRIGGER SALTY RECEPTORS, AND VARIOUS ORGANIC COMPOUNDS TRIGGER BITTER AND UMAMI RECEPTORS. THE CONCENTRATION AND COMBINATION OF THESE TASTE-STIMULATING COMPOUNDS DETERMINE THE OVERALL TASTE PROFILE OF A FOOD.

## SYNERGISTIC AND ANTAGONISTIC INTERACTIONS

IT'S IMPORTANT TO NOTE THAT FLAVORS ARE NOT SIMPLY THE SUM OF INDIVIDUAL COMPONENTS. SYNERGISTIC INTERACTIONS CAN ENHANCE OR DIMINISH TASTES AND AROMAS, WHILE ANTAGONISTIC INTERACTIONS CAN MASK OR NEUTRALIZE THEM. THIS COMPLEX INTERPLAY IS WHAT MAKES FOOD CHEMISTRY SO FASCINATING AND CHALLENGING TO REPLICATE.

## CHEMICAL REACTIONS IN FOOD PROCESSING AND PRESERVATION

BEYOND THE INHERENT COMPOSITION OF FOOD, NUMEROUS CHEMICAL REACTIONS OCCUR DURING PROCESSING AND STORAGE THAT SIGNIFICANTLY IMPACT ITS QUALITY, SAFETY, AND SHELF LIFE. UNDERSTANDING THESE TRANSFORMATIONS IS CRUCIAL FOR EFFECTIVE FOOD PRESERVATION AND THE DEVELOPMENT OF NEW FOOD PRODUCTS.

## UNDERSTANDING OXIDATION AND RANCIDITY

AS MENTIONED EARLIER, LIPID OXIDATION IS A MAJOR CONCERN FOR FOOD SPOILAGE. IT'S A CHAIN REACTION WHERE FREE

RADICALS ATTACK UNSATURATED FATTY ACIDS, LEADING TO THE FORMATION OF HYDROPEROXIDES, WHICH THEN BREAK DOWN INTO VOLATILE COMPOUNDS THAT CAUSE OFF-FLAVORS AND ODORS—RANCIDITY. ANTIOXIDANTS, BOTH NATURAL AND ADDED, ARE USED TO INHIBIT THIS PROCESS BY SCAVENGING FREE RADICALS.

## THE MAILLARD REACTION: BROWNING AND FLAVOR DEVELOPMENT

THIS NON-ENZYMATIC BROWNING REACTION, INVOLVING REDUCING SUGARS AND AMINO ACIDS, IS RESPONSIBLE FOR THE APPEALING BROWN COLORS AND COMPLEX FLAVORS IN MANY COOKED FOODS. THE SPECIFIC AMINO ACIDS AND SUGARS PRESENT, ALONG WITH TEMPERATURE AND pH, INFLUENCE THE TYPES OF COMPOUNDS FORMED. IT'S A CORNERSTONE OF DELICIOUS COOKING, FROM CRUSTY BREAD TO SAVORY ROASTS.

## ENZYMATIC REACTIONS IN FOOD

ENZYMES, BIOLOGICAL CATALYSTS, ARE PRESENT IN MANY RAW FOODS AND CAN CONTINUE TO BE ACTIVE EVEN AFTER HARVESTING. FOR EXAMPLE, ENZYMES IN FRUITS CAN CAUSE BROWNING WHEN CUT SURFACES ARE EXPOSED TO AIR (POLYPHENOL OXIDASE). BLANCHING (BRIEFLY HEATING) IS OFTEN USED TO INACTIVATE THESE ENZYMES AND PREVENT UNDESIRABLE CHANGES DURING FREEZING OR PROCESSING.

## THE ROLE OF ACIDS AND BASES IN FOOD

ACIDS AND BASES PLAY PIVOTAL ROLES IN FOOD. ACIDITY (LOW pH) INHIBITS MICROBIAL GROWTH, MAKING IT A KEY PRESERVATIVE IN PRODUCTS LIKE PICKLES AND JAMS. ACIDS CAN ALSO TENDERIZE MEAT, DENATURE PROTEINS IN CHEESE MAKING (E.G., THE LACTIC ACID PRODUCED BY BACTERIA), AND CONTRIBUTE SOUR FLAVORS. BASES, WHILE LESS COMMON AS PRIMARY INGREDIENTS, CAN INFLUENCE COLOR (E.G., ALKALINE CONDITIONS IN SOME COOKIE RECIPES) AND BROWNING REACTIONS.

## FOOD ADDITIVES AND THEIR CHEMICAL FUNCTIONS

FOOD ADDITIVES ARE SUBSTANCES ADDED TO FOOD TO PRESERVE FLAVOR, IMPROVE APPEARANCE, OR ENHANCE OTHER QUALITIES. WHILE SOMETIMES VIEWED WITH SKEPTICISM, MANY ARE ESSENTIAL FOR MODERN FOOD PRODUCTION AND SAFETY, AND THEIR USE IS STRICTLY REGULATED.

- **PRESERVATIVES:** SUCH AS SORBATES AND BENZOATES, INHIBIT MICROBIAL GROWTH.
- **ANTIOXIDANTS:** LIKE VITAMIN C (ASCORBIC ACID) AND BHA/BHT, PREVENT OXIDATION AND RANCIDITY.
- **EMULSIFIERS:** LECITHIN AND MONO- AND DIGLYCERIDES, HELP MIX OIL AND WATER.
- **THICKENERS AND STABILIZERS:** GUMS AND PECTINS, IMPROVE TEXTURE AND CONSISTENCY.
- **COLORANTS:** NATURAL OR SYNTHETIC, ENHANCE VISUAL APPEAL.
- **FLAVOR ENHANCERS:** MONOSODIUM GLUTAMATE (MSG), BOOST SAVORY NOTES.

EACH ADDITIVE HAS A SPECIFIC CHEMICAL FUNCTION, AND THEIR EFFECTIVENESS AND SAFETY ARE RIGOROUSLY TESTED. UNDERSTANDING THE CHEMISTRY BEHIND THESE ADDITIVES HELPS DEMYSTIFY THEIR PURPOSE AND BENEFITS IN THE FOODS WE CONSUME.

# EMERGING TRENDS IN FOOD CHEMISTRY

THE FIELD OF FOOD CHEMISTRY IS CONSTANTLY EVOLVING, DRIVEN BY CONSUMER DEMAND FOR HEALTHIER, MORE SUSTAINABLE, AND INNOVATIVE FOOD PRODUCTS. EMERGING TRENDS INCLUDE THE DEVELOPMENT OF PLANT-BASED PROTEIN ALTERNATIVES, THE USE OF NOVEL FOOD PROCESSING TECHNOLOGIES LIKE HIGH-PRESSURE PROCESSING, AND A DEEPER UNDERSTANDING OF THE GUT MICROBIOME'S INTERACTION WITH FOOD COMPONENTS.

CONSUMERS ARE INCREASINGLY INTERESTED IN FUNCTIONAL FOODS, THOSE THAT OFFER HEALTH BENEFITS BEYOND BASIC NUTRITION, OFTEN THROUGH THE STRATEGIC USE OF SPECIFIC CHEMICAL COMPOUNDS OR INGREDIENTS. RESEARCH INTO PERSONALIZED NUTRITION, TAILORING DIETARY RECOMMENDATIONS BASED ON INDIVIDUAL GENETIC MAKEUP AND METABOLIC RESPONSES, ALSO RELIES HEAVILY ON INTRICATE FOOD CHEMISTRY PRINCIPLES. FURTHERMORE, THE QUEST FOR SUSTAINABLE FOOD SYSTEMS IS SPURRING INNOVATION IN REDUCING FOOD WASTE THROUGH ADVANCED PRESERVATION TECHNIQUES AND THE UTILIZATION OF BY-PRODUCTS, ALL UNDERPINNED BY A THOROUGH UNDERSTANDING OF FOOD'S CHEMICAL NATURE.

THIS JOURNEY THROUGH CORE FOOD CHEMISTRY CONCEPTS REVEALS THAT EVERY BITE WE TAKE IS A TESTAMENT TO INTRICATE MOLECULAR INTERACTIONS AND FASCINATING CHEMICAL TRANSFORMATIONS. FROM THE SIMPLE STRUCTURE OF A SUGAR MOLECULE TO THE COMPLEX NETWORK FORMED BY PROTEINS IN A COOKED STEAK, CHEMISTRY IS THE SILENT ORCHESTRATOR OF OUR CULINARY WORLD.

## Q: WHAT IS THE MOST IMPORTANT ROLE OF WATER IN FOOD CHEMISTRY?

A: THE MOST IMPORTANT ROLE OF WATER IN FOOD CHEMISTRY IS ITS FUNCTION AS A UNIVERSAL SOLVENT. IT DISSOLVES SUGARS, SALTS, AND FLAVOR COMPOUNDS, MAKING THEM ACCESSIBLE FOR TASTE PERCEPTION AND FACILITATING A WIDE RANGE OF CHEMICAL REACTIONS THAT ARE CRUCIAL FOR FOOD PROCESSING, PRESERVATION, AND SENSORY QUALITIES.

## Q: HOW DO CARBOHYDRATES CONTRIBUTE TO THE TEXTURE OF FOOD?

A: CARBOHYDRATES CONTRIBUTE TO FOOD TEXTURE IN SEVERAL WAYS. COMPLEX CARBOHYDRATES LIKE STARCH CAN ABSORB WATER AND SWELL, LEADING TO THICKENING IN SAUCES AND PROVIDING STRUCTURE IN BAKED GOODS WHEN THEY GELATINIZE. CELLULOSE, A TYPE OF FIBER, ADDS BULK AND A FIBROUS TEXTURE TO PLANT-BASED FOODS.

## Q: WHAT IS THE DIFFERENCE BETWEEN THE MAILLARD REACTION AND CARAMELIZATION?

A: THE MAILLARD REACTION IS A COMPLEX BROWNING PROCESS THAT OCCURS BETWEEN REDUCING SUGARS AND AMINO ACIDS, PRODUCING A WIDE ARRAY OF FLAVOR AND AROMA COMPOUNDS AND BROWN PIGMENTS. CARAMELIZATION, ON THE OTHER HAND, IS THE BROWNING OF SUGARS SOLELY DUE TO HEAT IN THE ABSENCE OF AMINO ACIDS, RESULTING IN A SWEETER, NUTTY FLAVOR PROFILE.

## Q: WHY ARE LIPIDS IMPORTANT FOR FLAVOR IN FOOD?

A: LIPIDS ARE IMPORTANT FOR FLAVOR BECAUSE THEY ACT AS EXCELLENT CARRIERS FOR FAT-SOLUBLE FLAVOR COMPOUNDS. MANY AROMATIC MOLECULES DISSOLVE IN FATS AND OILS, AND AS THESE LIPIDS MELT OR ARE CONSUMED, THEY RELEASE THESE FLAVOR COMPOUNDS, CONTRIBUTING SIGNIFICANTLY TO THE OVERALL TASTE AND AROMA EXPERIENCE OF FOOD.

## Q: HOW DOES PROTEIN DENATURATION AFFECT FOOD?

A: PROTEIN DENATURATION, THE UNFOLDING OF PROTEIN STRUCTURES CAUSED BY HEAT, ACID, OR MECHANICAL AGITATION, SIGNIFICANTLY AFFECTS FOOD. IT CAN ALTER TEXTURE (E.G., MAKING MEAT FIRM, OR EGG WHITES SOLID), CHANGE SOLUBILITY, AND INFLUENCE EMULSIFYING OR FOAMING PROPERTIES.

### **Q: WHAT IS WATER ACTIVITY AND WHY IS IT IMPORTANT IN FOOD PRESERVATION?**

A: WATER ACTIVITY ( $A_w$ ) MEASURES THE AMOUNT OF UNBOUND WATER AVAILABLE IN A FOOD PRODUCT, WHICH IS CRUCIAL FOR MICROBIAL GROWTH AND CHEMICAL REACTIONS. LOW WATER ACTIVITY FOODS ARE LESS PRONE TO SPOILAGE AS MICROORGANISMS CANNOT EASILY ACCESS WATER TO THRIVE, THUS EXTENDING SHELF LIFE.

### **Q: CAN YOU GIVE AN EXAMPLE OF AN ENZYMATIC REACTION IN FOOD THAT WE MIGHT WANT TO PREVENT?**

A: AN EXAMPLE OF AN ENZYMATIC REACTION THAT WE OFTEN WANT TO PREVENT IS THE BROWNING THAT OCCURS IN CUT FRUITS AND VEGETABLES, LIKE APPLES OR AVOCADOS. THIS IS CAUSED BY ENZYMES SUCH AS POLYPHENOL OXIDASE, WHICH REACT WITH OXYGEN TO PRODUCE BROWN PIGMENTS. BLANCHING (BRIEFLY HEATING) IS A COMMON METHOD TO INACTIVATE THESE ENZYMES.

### **Q: WHAT IS THE CHEMICAL FUNCTION OF AN EMULSIFIER IN FOOD?**

A: THE CHEMICAL FUNCTION OF AN EMULSIFIER IN FOOD IS TO STABILIZE MIXTURES OF OIL AND WATER, WHICH NORMALLY DO NOT MIX. EMULSIFIERS HAVE MOLECULES WITH BOTH HYDROPHILIC (WATER-ATTRACTING) AND LIPOPHILIC (OIL-ATTRACTING) PARTS, ALLOWING THEM TO BRIDGE THE GAP BETWEEN OIL AND WATER PHASES, PREVENTING SEPARATION.
